proprioception KINESTHETIC SENSE.

prosopagnosia Inability to recognize familiar faces that is not due to impaired visual acuity or level of consciousness.

prospective study Study based on observing events as they occur.

prototaxic Harry Stack Sullivan's term for primitive processes. *See also* primary process.

pseudoaggression Neurotic defense in which h patient denies basic masochistic feelings and displays them, instead, as false aggression.

pseudoauthenticity False or copied expression of thoughts and feelings.

pseudocollusion Sense of closeness, relationship, or cooperation that is not real but is based on transference.

pseudocyesis Rare condition in which a nonpregnant patient has the signs and symptoms of pregnancy, such as abdominal distention, breast enlargement, pigmentation, cessation of menses, and morning sickness.

pseudodementia 1. Dementia-like disorder that can be reversed by appropriate treatment and is not caused by organic brain disease. The current preferred term is Depressive Cognitive Disorder. **2.** Condition in which a patient shows an exaggerated indifference to their surroundings in the absence of a mental disorder; also occurs in depression and factitious disorders.

pseudologia fantastica Disorder characterized by uncontrollable lying in which a patient elaborates extensive fantasies that he freely communicates.

pseudomotor agitation Physical and mental overactivity that is usually nonproductive and is associated with a feeling of inner turmoil, as seen in agitated depression.

pseudoparkinsonism Syndrome that resembles Parkinson disease, resulting from long-term use of antipsychotic drugs. Also called drug-induced parkinsonism.

psilocin *See* psilocybin.

Telegram: @medical_k

www.konkur.in

psilocybin 4-Phosphoryloxy-*N*′,*N*′-dimethyltryptamine, the active ingredient of various Mexican hallucinogenic mushrooms, which acts as a psychedelic drug producing changes in perception and mood and alterations of consciousness. A variation is called psilocin.

PSRO Professional Standards Review Organization.

psychalgia PSYCHOGENIC PAIN DISORDER.

psychasthenia Obsolete term used by Pierre Janet to describe a syndrome characterized by fears and phobias.

psyche Mind, as divided into conscious, preconscious, and unconscious in Sigmund Freud's topographic model.

psychedelic Denoting drugs that may induce hallucinations and psychotic states. LSD is the prototype; other psychedelic drugs include mescaline, psilocybin, and marijuana.

psychiatric emergency Disturbance in thoughts, feelings, or actions for which immediate treatment is necessary; for example, suicide intent.

psychiatric illness *See* mental disorder.

psychiatric nurse Clinical nurse specialist who functions as part of the mental health team, usually in an institutional setting; often carries out individual, family, and group psychotherapy.

psychiatric social worker Skilled professional, trained in social work, who works with psychiatrists, usually in an institutional setting; evaluates family, environmental, and social factors in the patient's illness; may work in intake and reception with new patients; may follow-up and counsel after discharge, and also carry out individual, family, and group psychotherapy and participate in community organizations.

psychiatrist Medical doctor whose specialty is the study and treatment of mental disorders. After receiving the M.D. degree, a physician spends 4 years as a resident in a hospital setting. When they pass the written and oral examinations of the American Board of Psychiatry and Neurology, they become a diplomat in psychiatry and is said to be Board certified.

Telegram: @medical_k

www.konkur.in

psychiatry Branch of medicine concerned with the prevention, cause, and treatment of mental disorders.

psychic determinism Freudian concept that all mental phenomena have specific antecedent causes, often operating on an unconscious level.

psychic energizer Rarely used term for any antidepressant or stimulant drug.

psychic helplessness *See* helplessness.

psychic trauma Psychologically upsetting event that may have lasting consequences on a person's thinking, feeling, or behavior.

psychoactive drug PSYCHOTHERAPEUTIC DRUG.

psychoactive substance abuse *See* substance use disorder.

psychoactive substance dependence DSM term for drug dependence.

psychoactive substance-induced mental disorder Mental disorder caused by the direct effects on the nervous system of a drug or other substance. In DSM, the substances listed are alcohol; sedatives, hypnotics, or anxiolytics; inhalants; opioids; cocaine; amphetamine or similarly acting sympathomimetics; phencyclidine (PCP) or similarly acting arylcyclohexylamine; hallucinogens; cannabis; nicotine; and caffeine.

psychoanalysis Theory of human mental phenomena and behavior, a method of psychic investigation and research, and a form of psychotherapy originally formulated by Sigmund Freud. As a technique for exploring the mental processes, psychoanalysts includes the use of free association and the analysis and interpretation of dreams, resistances, and transferences. As a form of psychotherapy, it uses the investigative technique, guided by Freud's libido and instinct theories and by ego psychology, to gain insight into a person's unconscious motivations, conflicts, and symbols and thus to effect a change in maladaptive behavior. Also called analysis in depth.

psychoanalyst Psychotherapist, usually a psychiatrist, who has had training in psychoanalysis and who uses its techniques in a treatment setting.

Telegram: @medical_k

www.konkur.in

psychoanalytic group psychotherapy Method of group psychotherapy pioneered by Alexander Wolf and based on the operational principles of individual psychoanalytic therapy; analysis and interpretation of a patient's transferences, resistances, and defenses are modified to take place in a group setting.

psychobiology Adolf Meyer's term referring to the study of the human being as an integrated unit, incorporating psychological, social, and biologic functions.

psychodrama Psychotherapy method originated by Jacob Moreno in which personality makeup, interpersonal relationships, conflicts, and emotional problems are expressed and explored through dramatization. Therapeutic dramatization of emotional problems includes: (1) protagonist or patient, the person who presents and acts out their emotional problems with the help of (2) auxiliary egos, persons trained to act and dramatize the different aspects of the patient that are called for in a particular scene in order to help the patient express feelings, and (3) the director, leader, or therapist, who guides those involved in the drama for a fruitful and therapeutic session.

psychodynamics Science of mental forces and motivations that influence human behavior and mental activity; the role of unconscious motivation in the causation of human behavior is

psychoendocrinology Study of the role of hormones on thinking, behavior, and emotional disorder.

Psychose passionelle *See* erotomania.

psychogenic Produced or caused by mental factors, rather than organic factors; usually refers to a symptom or an illness.

psychogenic amnesia Dissociative disorder characterized by the sudden inability to recall information stored in memory in the absence of an underlying organic mental disorder; in DSM listed as dissociative amnesia.

psychogenic fugue Dissociative disorder characterized by periods of total amnesia in which one travels and assumes a new identity. In DSM listed as Dissociative amnesia, with dissociative fugue. *See also* fugue; psychogenic amnesia.

Telegram: @medical_k

www.konkur.in

psychogenic pain disorder Condition in which there is a preoccupation with pain for at least 6 months in the absence of organic pathology to account for the pain. Also called psychalgia; somatoform pain disorder in previous versions of DSM.

psychohistory Approach to history that examines events within a psychological framework; attempts to connect individual and collective ideas and emotions with wider historical currents.

psychoimmunology Study of the relationship between the immune system and emotions.

psychokinesis Parapsychological phenomenon in which directed thought processes influence physical events.

psycholinguistics Exploration of the psychological factors involved in the development and use of language.

psychological defense system *See* defense mechanism.

psychological factor affecting physical condition Disorder characterized by physical symptoms partially caused or affected by psychological factors; physiologic and organic changes stem in part from a sustained emotional disturbance; for example, atopic dermatitis, migraine, ulcer. Also called psychophysiologic disorder; psychosomatic disorder.

psychologist Person trained in psychology, usually with a graduate degree (M.A., Ph.D.).

psychology Study and profession concerned with mental processes and behavior.

psychometry Science of testing and measuring mental and psychological functioning.

psychomotor Relating to combined physical and mental activity.

psychomotor agitation Physical and mental overactivity associated with a feeling of inner turmoil, as seen in agitated depression.

psychomotor epilepsy COMPLEX PARTIAL SEIZURE.

psychomotor retardation Slowing of mental and physical activity, common in depression.

psychomotor stimulant Drug that arouses the patient through its central excitatory properties; for example, amphetamine, methylphenidate (Ritalin). Also called analeptic.

Telegram: @medical_k

www.konkur.in

psychoneuroimmunology Study of psychological factors as causes of diseases or their effect on the course of disease, particularly as it relates to the immune system. *See also* psychoimmunology.

psychoneurosis NEUROSIS.

psycho-oncology Study of the role of emotions and their relation to cancer in terms of prevention, diagnosis, and treatment.

psychopathic personality Former term for the personality characteristic of antisocial personality disorder.

psychopathologic Denoting abnormal, maladaptive behavioral or mental activity.

psychopathology 1. Study of mental disorders. **2.** Abnormal, maladaptive behavioral or mental activity.

psychopharmacology Study of the mental and behavioral effects of drugs. *See also* pharmacokinetics.

psychophysiologic disorder PSYCHOLOGICAL FACTOR AFFECTING PHYSICAL CONDITION.

psychopolitics 1. Psychological dimensions of political behavior, such as the reciprocal influence on persons of political environments and their societies. **2.** Specific tactics of politicians that are intended to yield benefits to them through the use of psychological strategies.

psychosexual development 1. Broadly, the maturation and development of the sexuality of a person throughout the life cycle. **2.** More specifically, in psychoanalysis, series of dynamic and crucial developmental stages that each person passes through and that influence basic personality characteristics in later life; the stages or phases are oral, anal, phallic, latency, and genital.

psychosexual disorder Disorder of sexual functioning, desire, or performance that is caused, wholly or partly, by psychological factors.

psychosis Mental disorder in which a person's thoughts, affective response, ability to recognize reality, and ability to communicate and relate to others are sufficiently impaired to grossly interfere with their capacity to deal with reality; the classical characteristics

Telegram: @medical_k

www.konkur.in

of psychosis are impaired reality testing, hallucinations, delusions, and illusions.

psychosocial deprivation Deprivation of social and intellectual stimulation; believed to be a causative factor in mental retardation and emotional disorders in children.

psychosocial development Developmental progress of a person with regard to social relations and social reality, as primarily described by Erik Erikson. Specific developmental tasks characterize successive chronologic periods from infancy through maturity: trust versus mistrust (infancy), autonomy versus doubt (toddler), initiative versus guilt (preschool), industry versus inferiority (school age), identity versus identity diffusion (adolescence), intimacy versus isolation (young adulthood), generativity versus self-absorption (adulthood), and integrity versus despair (mature age).

psychosocial dwarfism Syndrome usually first manifested in children 2 to 3 years of age, who typically are unusually short, have frequent growth hormone abnormalities, and have severe behavioral disturbances; all of these symptoms are the result of an inimical caretaker–child relationship and resolve without any medical or psychiatric treatment upon being placed in a more favorable domicile. Also called psychosocially determined short stature.

psychosocially determined short stature PSYCHOSOCIAL DWARFISM.

psychosocial stressor STRESS.

psychosomatic disorder PSYCHOLOGICAL FACTOR AFFECTING PHYSICAL CONDITION.

psychosurgery Neurosurgical intervention to treat a mental disorder that involves destruction or ablation of brain tissue.

psychotherapeutic drug Drug used to alter abnormal thinking, feelings, or behavior; traditionally divided into classes of antipsychotic, antidepressant, antimanic, and antianxiety (anxiolytic) drugs. Also called psychoactive drug; psychotropic drug.

Telegram: @medical_k

www.konkur.in

psychotherapist Person trained to treat mental, emotional, and behavioral disorders. For types of therapists, see the specific term.

psychotherapy Treatment for mental illness and behavioral disturbances in which a trained person establishes a professional contract with the patient and through definite therapeutic communication, both verbal and nonverbal, attempts to alleviate the emotional disturbance, reverse or change maladaptive patterns of behavior, and encourage personality growth and development; distinguished from other forms of psychiatric treatment such as the somatic therapies, for example, drug and convulsive therapies.

psychotic 1. Person suffering from a psychosis. **2.** Denoting or characteristic of a psychosis.

psychotic depressive reaction Psychosis distinguished by depressed mood precipitated by some event, usually in a person who had not previously demonstrated severe depression. Also called major depressive disorder, single episode, with mood-congruent psychotic features, in DSM.

psychotomimetic drug Drug that produces psychic and behavioral changes that resemble psychosis; unlike other drugs that can produce organic psychosis as a toxic reaction (e.g., hallucinogenic and psychedelic drugs such as LSD, marijuana, mescaline), a psychotomimetic drug does not produce gross confusion, delirium, or overt memory impairment.

psychotropic drug PSYCHOTHERAPEUTIC DRUG.

PTSD Posttraumatic stress disorder.

puerperal psychosis *See* postpartum psychosis.

punishment Presentation of an aversive stimulus contingent on an operant response, resulting in a decreased probability of that response recurring. *See also* reinforcement.

Purging disorder Eating disorder characterized by recurrent episodes of self-induced vomiting, laxative and diuretic abuse, and/or the use of enemas after consuming small amounts of food; patients are normal weight and have distorted body image. In DSM-5, included in “Other Specified Feeding or Eating Disorders.”

Telegram: @medical_k

www.konkur.in

pyromania Compulsion to set fires.

Q

q-sort Technique of personality assessment based on the degree to which a standard set of descriptive statements are believed to describe a particular person.

quadrangular therapy Marital therapy that involves four people, the married pair and each spouse's therapist.

quality assurance Measurement and evaluation of medical and other related services provided with regard to their effectiveness, efficiency, appropriateness, and acceptability; such evaluation will trigger corrective or remedial action for services not meeting the desired standards.

quantitative variable Experimental factor that can be measured.

R

random Statistical term that means occurring by chance or without attention to selection or planning.

random sample In a given population, a group of subjects selected in such a manner that each member of the population has an equal probability of being selected for the sample.

random variable Variable for which the variation is determined by chance.

range Statistical measure of the variability of a set of values, defined as the difference between the largest value and the smallest value.

Rank, Otto (1884–1939) Austrian psychoanalyst, long-time secretary and recorder of the minutes of the Vienna Psychoanalytic Society, and one of Sigmund Freud's earliest followers, who split with him on the significance of the birth trauma, which Rank used as a basis of brief psychotherapy. Rank's works include *The Trauma of Birth* and *The Myth of the Birth of the Hero.*

rape Sexual intercourse without the person's consent and against their will, chiefly by force; usually heterosexual but may be

Telegram: @medical_k

www.konkur.in

homosexual.

rapid eye movement *See* REM latency; REM sleep.

rapport Conscious feeling of harmonious accord, sympathy, and mutual responsiveness between two or more persons; contributes to an effective therapeutic process in both group and individual settings.

rapture-of-the-deep syndrome Psychosis, seen in scuba and deep-sea divers, characterized by disorientation and loss of judgment and skill, and associated with excessive blood nitrogen levels; sensory deprivation may also contribute to this acute, self-limited mental disorder. Also called nitrogen narcosis.

rationalization Ernest Jones's term for an unconscious defense mechanism in which irrational or unacceptable behavior, motives, or feelings are logically justified or made consciously tolerable by plausible means.

Ray, Isaac (1807–1881) One of the original 13 founders of the American Psychiatric Association, known for his *Treatise on Medical Jurisprudence of Insanity* (1837).

rCBF Regional cerebral blood flow.

reaction formation Unconscious defense mechanism in which a person develops a socialized attitude or interest that is the direct antithesis of some infantile wish or impulse that is harbored either consciously or unconsciously. One of the earliest and most unstable defense mechanisms, closely related to repression; both are defenses against impulses or urges that are unacceptable to the ego.

reactive attachment disorder of infancy or early childhood Severe impairment of the ability to relate, beginning before age 5; presumed to develop from grossly pathologic care-giving.

reactive depression Mental disorder characterized by depression developing in reaction to some precipitating life event or circumstance.

reactive disorder Mental disorder judged to be a reaction to one or more life events or circumstances, without which the disorder would not have occurred. *See also* brief reactive psychosis; reactive depression; reactive schizophrenia.

Telegram: @medical_k

www.konkur.in

reactive schizophrenia Unofficial term for schizophrenia attributed primarily to predisposing or precipitating environmental factors. *Compare* process schizophrenia.

reading disorder Reading below the expected level for a child's age, education, and intelligence.

reality Totality of objective things and factual events; includes everything that is perceived by a person's special senses and is validated by other people.

reality principle In psychoanalysis, ego processes that modify the demands of the pleasure principle to meet the inescapable demands and requirements of the outside world; net result is behavior that gratifies id impulses within realistic limits. *See also* pleasure principle.

reality testing Fundamental ego function that consists of tentative actions that test and objectively evaluate the nature and the limits of the environment; includes the ability to differentiate between the external world and the internal world and to accurately judge the relation between the self and the environment.

recall Process of bringing stored memories into consciousness. *See* memory.

receiver operating characteristic (ROC) Special statistical method, recently used in psychiatry, which gives a balance between sensitivity and specificity for a diagnostic test, for example, Dexamethasone Suppression Test. The method was derived from signal detection theory as a way to determine how well an electronic receiver was able to distinguish signal from noise.

recent memory Recall of events over the past few days.

recent past memory Recall of events over the past few months.

receptive aphasia Organic loss of ability to comprehend the meaning of words; fluid and spontaneous, but incoherent and nonsensical, speech. *See also* fluent aphasia and sensory aphasia.

receptive dysphasia Difficulty in comprehending oral language; the impairment involves both comprehension and production of language.

Telegram: @medical_k

www.konkur.in

receptors Proteins in the neuronal membrane that are exposed in part to the extracellular fluid and specifically recognize neuromessengers; stimulation of receptors generally causes a biologic response to occur.

reciprocal inhibition and desensitization Behavior therapy in which a person is conditioned to associate comfortable, supportive surroundings with anxiety-producing stimuli, thus decreasing the anxiety associated with those stimuli.

recovered memory syndrome Condition that occurs when a repressed memory of a traumatic experience is brought back to consciousness, usually during psychotherapy or under hypnosis. A variant of this condition, false memory syndrome, occurs if the recalled memory did not actually happen, but the person believes the memory to be true.

recurrent brief depressive disorder Multiple, brief (less than 2 weeks duration) episodes of depressive symptoms.

recurrent depressive episode Depression that lasts between 2 and 13 days and occurs at least once a month.

recurrent isolated sleep paralysis Sleep disorder characterized by the inability to make voluntary movements while partially conscious at sleep onset or awakening. *See also* parasomnias.

refractory period Temporary state of psychophysiologic resistance to sexual stimulation immediately after orgasm in the human sexual response cycle, as described by Masters and Johnson.

reframing Technique used in family therapy whereby a problem or conflict is viewed by the therapist in an entirely different and sometimes startling perspective, thus enabling the family members to achieve objectivity.

regional cerebral blood flow (rCBF) Test using xenon-133, a low-energy gamma ray-emitting isotope, to determine blood flow in the brain; useful for studying diseases that have a decrease in the amount of brain tissue, for example, dementia, ischemia, atrophy.

registration *See* memory.

regression Unconscious defense mechanism in which a person undergoes a partial or total return to earlier patterns of adaptation;

Telegram: @medical_k

www.konkur.in

observed in many psychiatric conditions, particularly schizophrenia.

regressive-reconstructive approach Psychotherapeutic procedure in which regression is made an integral element of the treatment process; an original traumatic situation is reproduced to gain new insight and to effect personality change and emotional maturation.

rehabilitation All methods and techniques used in an attempt to achieve maximal function and optimal adjustment in a given patient; the physical, mental, social, and vocational preparation of a patient for the fullest possible life compatible with their abilities and disabilities. Inasmuch as the process aims also to prevent relapses or recurrences of the patient's condition, it is sometimes called tertiary prevention.

Reich, Wilhelm (1897–1957) Austrian psychoanalyst who emigrated to the United States in 1939. He coined the term "orgone," a kind of universally pervasive physical and biologic energy that was typified by the pent-up libidinal energy that sought free expression and release through orgasm.

Reik, Theodor (1888–1969) Psychoanalyst and early follower of Sigmund Freud, who considered Reik one of his most brilliant pupils; Freud's book, *The Question of Lay Analysis*, was written to defend Reik's ability to practice psychoanalysis without medical training. Reik made many valuable contributions to psychoanalysis on the subjects of religion, masochism, and therapeutic technique.

reinforcement *Positive reinforcement* refers to the process by which certain consequences of behavior increase the probability that the behavior will occur again. Positive reinforcers tend to be viewed as pleasant. *Negative reinforcement* describes the process by which behavior that leads to the removal of an unpleasant event strengthens that behavior. Negative reinforcers tend to be viewed as unpleasant. Stimuli that possess inherent reinforcing characteristics are called *primary reinforcers*, for example, food. Stimuli that acquire reinforcing characteristics by being paired with primary reinforcers are called *conditioned reinforcers*, for example, money. *See also* conditioning.

reinforcer Reinforcing stimulus. *See* reinforcement.

Telegram: @medical_k

www.konkur.in

relatedness Sense of sympathy and empathy with regard to others; sense of oneness with others. *Compare* isolation; alienation.

relational problems Impaired functioning of a relational unit. In DSM, parent–child relational problem, partner relational problem, and sibling relational problem.

relative frequency *See* frequency.

relative risk Epidemiologic measure of the risk of developing a disorder in a specified subset of the population as compared with the total population or a different subset of it. Comparison is usually made between groups exposed and groups not exposed to a particular hereditary or environmental factor to gain information about the role of that factor in the disorder in question. Relative risk is then expressed as a ratio of the frequency of the disorder in exposed persons to its frequency in those not exposed.

Relative Value Scale Payment scale for medical services developed at Harvard University that reimburses physicians in terms of time spent with patients, office overhead expenses, years of training, and cognitive skills; under the program, surgeons would receive less money and internists would receive more money from third-party (insurance) carriers than under previous payment scale programs. Also called Resource-Based Relative Value Scale (RBRVS).

reliability Research term meaning replicability, that is, the degree to which a test result or experimental finding can be confirmed by repetition. *See also* validity.

religious delusion Delusion involving the Deity or theologic themes.

reminiscence Recall or recollection of past experiences, with alternations of remembering an apparently lost memory and forgetting one that was just there.

remission Significant improvement or recovery which may or may not be permanent. *Compare* intermission.

remote memory LONG-TERM MEMORY.

remotivation Group treatment technique used patients in mental hospitals to encourage them and vocational skills.

Telegram: @medical_k

www.konkur.in

REM (rapid eye movement) latency First REM episode of the night, about 90 minutes after sleep onset; shortening of REM latency frequency occurs with disorders such as depression and narcolepsy.

REM (rapid eye movement) sleep Stage of sleep during which dreaming occurs and the sleeper exhibits coordinated rapid eye movement (REM). The electroencephalogram demonstrates a desynchronized pattern of cerebral activity. It accounts for one-fourth to one-fifth of total sleep time. Also called paradoxical sleep.

REM sleep behavior disorder Sleep disorder characterized by the absence of sleep paralysis (atonia) during the REM stage of sleep; consequently, patients will act out their dreams, putting themselves and/or their partners at risk of physical injury. *See also* parasomnias.

repetition compulsion Psychoanalytic concept of an impulse to repeat earlier experiences and situations.

repetitive pattern Continual attitude or mode of behavior characteristic of a person and performed mechanically or unconsciously.

repression Freud's term for an unconscious defense mechanism in which unacceptable mental contents are banished or kept out of consciousness; important in both normal psychological development and in neurotic and psychotic symptom formation. Freud recognized two kinds of repression: (1) repression proper, in which the repressed material was once in the conscious domain; (2) primal repression, in which the repressed material was never in the conscious realm. *Compare* suppression.

repressive-inspirational group psychotherapy Group therapy in which discussion is intended to bolster the patients' morale and help them avoid undesired feelings; used primarily with large groups of seriously regressed patients in institutional settings.

reserpine Alkaloid extracted from the *Rauwolfia serpentina* plant, formerly used as an antipsychotic agent because of its sedative effects but currently used primarily as an antihypertensive agent, although this use has declined partly because of its potential to produce a considerable incidence of nightmares and suicidal

Telegram: @medical_k

www.konkur.in

depression; that untoward effect may be related to reserpine's depletion of catecholamines at critical sites in the central nervous system.

resident 1. In psychiatry, a patient living in a treatment center for a prescribed period of time. **2.** In medicine, a physician in postgraduate training after graduation from medical school; 4 years of residency training are necessary to become a psychiatrist.

residential treatment facility Center where patients live and receive treatment appropriate for their particular needs; a children's residential treatment facility ideally furnishes both educational and therapeutic experiences for the emotionally disturbed child. Also called a halfway house.

residual Denoting a condition in which a person's acute mental symptoms have subsided.

residual schizophrenia Schizophrenia in which the patient no longer is psychotic but does have some remaining signs of the illness.

resistance Conscious or unconscious opposition to the uncovering of unconscious material; linked to underlying psychological defense mechanisms against impulses from the id that are threatening to the ego.

resistant attachment As described by Mary Ainsworth, a child's simultaneous yet antithetical wish for and avoidance of their mother's approach. *Compare* avoidant attachment; secure attachment.

resolution phase Final stage in the human sexual response cycle, as described by Masters and Johnson, during which the sexual system returns to its normal, nonexcited state following orgasm.

respondent conditioning CLASSICAL CONDITIONING. *See* conditioning.

restless legs syndrome (RLS) A syndrome characterized by an uncomfortable, subjective sensation of the limbs, usually the legs. Tends to be worse at night.

restricted affect Reduction in intensity of feeling tone that is less severe than in blunted affect but clearly reduced. *See* constricted

Telegram: @medical_k

www.konkur.in

affect.

retardation Reduction or slowing down of mental and physical activity, as often observed in depression. *See also* mental retardation.

retarded ejaculation INHIBITED MALE ORGASM.

retention *See* memory.

retroflexion Psychoanalytic term used notably by Sandor Rado to describe the turning of rage onto oneself.

retrograde amnesia Loss of memory for events preceding the onset of the amnesia. *Compare* anterograde amnesia.

retrospective falsification Memory becomes unintentionally (unconsciously) distorted by being filtered through a person's present emotional, cognitive, and experiential state.

retrospective study Investigation based on past data or past events, such as a case control study or a case history study.

Rett disorder A progressive condition characterized by deceleration in head growth, loss of purposeful hand movements, development of stereotyped hand movements (e.g., hand wringing), psychomotor retardation, loss of social engagement, loss of acquired speech, and ataxia between the ages of 6 months to 2 years.

reversal In psychoanalysis, an impulse's change from passive to active or from active to passive, as when a destructive impulse changes from masochism to sadism or vice versa.

right to refuse treatment Legal doctrine that holds that a person cannot be forced to have treatment against their will unless it is a life-and-death emergency.

right to treatment Legal principle that a facility that has assumed the responsibility of providing treatment is legally obligated to provide adequate treatment for a patient.

rigidity In psychiatry, a person's resistance to change, a personality trait.

risk factor Factor that accounts for the increased risk of a disorder. *See also* attributable risk; relative risk.

Telegram: @medical_k

www.konkur.in

ritual 1. Formalized activity practiced by a person to reduce anxiety, as in obsessive-compulsive disorder. **2.** Ceremonial activity of cultural origin.

ritualistic behavior Automatic behavior of cultural or psychogenic origin.

RLS Restless legs syndrome.

ROC Receiver operating characteristics.

Rogers, Carl R. (1902–1987) American psychologist who developed person-centered or client-centered theory of personality and psychotherapy, utilizing the concepts of self-actualization and self-direction; emphasized subjective experiential life of people and considered the self as a primary entity in both adjustment and maladjustment in people.

role Pattern or type of behavior developed under the influence of significant people in the person's environment. When the behavior pattern conforms to the expectations and demands of other people, it is said to be a complementary role; if it does not, it is known as a noncomplementary role. *See also* alternating role.

role playing Psychodrama technique in which persons are trained to function more effectively in their real-life roles. In the therapeutic setting of psychodrama, protagonists are free to try and to fail in their roles, for they are given the opportunity to try again until they succeed; new approaches to feared situations can thus be learned and applied outside the therapeutic setting.

Romberg sign Markedly increased swaying of the body or falling when a person stands erect with heels together and closes the eyes; typically indicates dysfunction of the dorsal column proprioceptive system, but it may also be seen in hysteria.

Rorschach Test Projective test, developed by Hermann Rorschach, in which the person is asked for associations in response to a series of inkblot pictures.

rumination Constant preoccupation with and thinking about a single idea or theme, as in obsessive-compulsive disorder.

rumination disorder of infancy Rare eating disorder of early childhood characterized by recurrent regurgitation of food in the absence of nausea, retching, or associated gastrointestinal

Telegram: @medical_k

www.konkur.in

disorder; regurgitated food is either ejected from the mouth or rechewed and reswallowed. Also called merycism.

Rush, Benjamin (1745–1813) Father of American psychiatry whose book, *Medical Inquiries and Observations upon the Diseases of the Mind* (1872), was the only American textbook on psychiatry until the end of the 19th century.

S

SAD Seasonal affective disorder.

sadism Paraphilia in which sexual gratification is achieved by inflicting pain or humiliation on a partner; first described by the French writer the Marquis de Sade (1740–1814). *See also* masochism; sadomasochistic relationship.

sadistic personality disorder Disorder in which a person shows a pervasive pattern of cruel, demeaning, and aggressive behavior whereby physical cruelty or violence is used to inflict pain on others and not to achieve some goal; such a person is fascinated by violence, weapons, injury, or torture. Not a DSM diagnosis.

sadomasochistic relationship Relationship in which the enjoyment of suffering by one person (masochism) and the enjoyment of inflicting pain by the other person (sadism) are important and complementary attractions in their ongoing interaction.

SAMHSA Substance Abuse and Mental Health Services Administration. A branch of the U.S. Department of Health and Human Services charged with improving the quality and availability of treatments and services for substance abuse and mental illnesses.

sample Research term for a subset of observations selected from a population.

sanatorium Institution where patients are treated for chronic physical or mental diseases or where they are attended to during a period of recuperation.

satyriasis Morbid, insatiable sexual needs or desires in a male; may be caused by organic or psychiatric factors. *Compare* nymphomania.

Telegram: @medical_k

www.konkur.in

schedule of reinforcement Scheme of intermittent reinforcement in which a response is not reinforced every time it occurs. Four broad classes of intermittent schedules are based on either the number of responses required before an opportunity for reinforcement is presented or the passage of a certain amount of time before a given performance is reinforced (l) *fixed-ratio schedule,* in which reinforcement is delivered after a specified number of responses have occurred, for example, after every tenth response; (2) *variable-ratio schedule,* in which reinforcement is delivered on a schedule randomly changing around a given ratio, for example, after the third, sixth, then second response, and so on; (3) *fixed-interval schedule,* in which reinforcement is delivered contingent on the first required response after the elapse of a specified interval of time, for example, after every 10 minutes; and (4) *variable-interval schedule,* in which reinforcement is delivered after variable intervals of time have elapsed, for example, after 3, 6, then 2 hours, and so on. *See also* reinforcement.

schizoaffective disorder Psychotic disorder with signs and symptoms compatible with both a mood disorder and schizophrenia. In contrast to mood disorder with psychotic features, schizoaffective disorder is characterized by periods of at least 2 weeks without prominent mood symptoms.

schizoid fantasy Through fantasy, indulgence by a person in autistic retreat to resolve conflict and to obtain gratification; interpersonal intimacy is avoided and eccentricity serves to repel others. The individual does not fully believe in or insist on acting out the fantasies.

schizoid personality disorder Diagnostic category in DSM for persons with defects in the capacity to form social relationships but without other striking communicative or behavioral eccentricities. Also called introverted personality disorder.

schizophrenia Term introduced by Eugen Bleuler for a chronic, psychotic mental disorder of unknown etiology characterized by disturbances in thinking, mood, and behavior. The thinking disturbance is manifested by a distortion of reality, sometimes with delusions and hallucinations, accompanied by a fragmentation of

Telegram: @medical_k

www.konkur.in

associations that results in characteristic disturbances of speech; the mood disturbance includes ambivalence and inappropriate or constricted affective responses; the behavior disturbance may be manifested by apathetic withdrawal or bizarre activity. Subtypes of schizophrenia (disorganized, catatonic, paranoid, undifferentiated, and residual) are no longer formally in the DSM nomenclature, however they remain as useful descriptors. Formerly called dementia praecox.

schizophreniform disorder In DSM-5 a disorder similar to schizophrenia except that it lasts between 1 and 6 months.

schizotypal personality disorder Common term for mood disorder subtype characterized by depression, psychomotor slowing, hypersomnia, and hyperphagia that develops in autumn or winter and improves in spring and summer; not an official DSM-5 diagnosis.

schneiderian first rank symptoms Symptoms that Kurt Schneider, a German psychiatrist (1887–1967), considered to be of great pragmatic value in making a diagnosis of schizophrenia, including audible thoughts, arguing voices, thought withdrawal and insertion, delusions, and flat affect.

school phobia Young child's sudden fear of and refusal to attend school, usually considered a manifestation of separation anxiety but also may be a symptom of depression.

Schreber case One of Sigmund Freud's cases. Daniel Paul Schreber's published autobiographical account, entitled *Memoirs of a Neurotic* (1903), was analyzed by Freud (1911) and allowed him to decipher the fundamental meaning of paranoid processes and ideas, especially the relationship between repressed homosexuality and projective defenses.

scopophilia Sexual deviation in which a person achieves sexual gratification by viewing sexual acts or the genitals of others. *Compare* voyeurism.

scotoma 1. In psychiatry, a figurative blind spot in a person's psychological awareness. *See also* blind spot. **2.** In neurology, a localized visual field defect.

Telegram: @medical_k

www.konkur.in

screening Initial patient evaluation that includes medical and psychiatric history, mental status evaluation, and diagnostic formulation to determine the patient's suitability for a particular treatment modality.

screen memory Memory that serves as a cover-up for an associated painful memory.

SCT Sentence Completion Test.

SD Standard deviation.

SDA Serotonin-dopamine antagonist.

SDS Zung Self-Rating Depression Scale.

seasonal affective disorder (SAD) Mood disorder subtype characterized by depression, psychomotor slowing, hypersomnia, and hyperphagia that develops in autumn or winter and improves in spring and summer. **seasonal pattern**. *See* seasonal affective disorder.

secondary gain Obvious advantage that a person gains from an illness, such as gifts, attention, and release from responsibility. *Compare* primary gain.

secondary narcissism *See* narcissism.

secondary prevention *See* preventive psychiatry.

secondary process thinking In psychoanalysis, the form of thinking that is logical, organized, reality-oriented, and influenced by the demands of the environment; characterizes the mental activity of the ego. *Compare* primary process.

secondary retarded ejaculation After previous normal sexual functioning, the inability to ejaculate during coitus. *Compare* retarded ejaculation.

secondary sexual characteristics Physical characteristics, other than the external sexual organs, that distinguish male from female.

secure attachment As described by Mary Ainsworth, the positive, happy responses of a child following the mother's appearance.

sedative Drug that produces a calming or relaxing effect through central nervous system depression; for example, barbiturates, chloral hydrate, paraldehyde, and benzodiazepines. *Compare* hypnotic.

Telegram: @medical_k

www.konkur.in

seizure An attack or sudden onset of certain symptoms, such a convulsions, loss of consciousness, and psychic or sensory disturbances; seen in epilepsy and can be substance induced. For types of seizures, see the specific term.

selection bias Nonrepresentative sampling resulting in erroneous conclusions.

selective inattention Harry Stack Sullivan's term for inattentiveness to anxiety-generating areas.

selective mutism Persistent failure to speak in one or more specific social situations.

selective serotonin reuptake inhibitors (SSRIs) Drugs that increase the concentration of serotonin in the brain; commonly used for the treatment of depression and anxiety disorders.

self Psychophysical total of a person at any given moment, including conscious and unconscious attributes. *See also* identity.

self-actualization Abraham Maslow's term for the inborn capacity of people to direct themselves in the healthiest way, toward a level of completeness.

self-analysis Investigation of one's own psychic components, which plays a part in all analysis, although to a limited extent, since few people are capable of sustaining independent and detached attitudes to the degree necessary for this approach to be therapeutic.

self-awareness Sense of knowing oneself, particularly in terms of insight into one's own psychodynamics; a major goal of most psychotherapies.

self-defeating personality disorder Disorder in which persons avoid or undermine pleasurable experiences and are drawn to situations or relationships in which they will suffer, even when better options are available; positive personal events are responded to with guilt or depression, reasonable offers of assistance from others are rejected, and anger or rejecting responses from others are invited, leaving them feeling hurt or humiliated. Also called masochistic personality disorder.

self-discovery In psychoanalysis, the freeing of the repressed ego in a person who has been brought up to submit to the wishes of

Telegram: @medical_k

www.konkur.in

the significant others around him.

self-fulfilling prophecy Situation in which one predicts a type of behavior that eventually one carries out.

self-help groups Groups composed of persons who want to cope with a specific problem or life crisis; characterized by homogeneity and cohesion.

self-image One's conception of one's own identity, personality, and worth as a person.

self-reference Denoting a person's repeatedly referring the subject under discussion back to himself.

self-system Harry Stack Sullivan's term for a personality system designed to ward off anxiety and preserve a positive view of the self.

SEM Standard error of the mean.

senescence Aging, as determined by inherent or hereditary factors.

senile dementia Dementia secondary to diffuse cerebral atrophy associated with advancing age; onset is insidious, progression is slow and gradual, and no specific therapy is known.

senium Period of old age, generally after age 65.

sensate focus learning In the treatment of sexual disorders, exercises that focus on heightening sensory awareness to touch, sight, sound, and smell.

sensation Feeling or impression when the sensory nerve endings of any of the six senses (taste, touch, smell, sight, kinesthesia, and sound) are stimulated.

sense of self One's feeling of individuality, uniqueness, and self-direction.

sensitivity In research, the probability of a positive test result in one who has the disorder. *Compare* specificity.

sensitivity training group Group in which members seek to develop self-awareness and an understanding of group processes, rather than to gain relief from an emotional disturbance. *See also* encounter group; T-group.

sensorimotor period *See* Piaget, Jean.

sensorium Hypothetical sensory center in the brain that is involved with clarity of awareness about oneself and one's surroundings,

Telegram: @medical_k

www.konkur.in

including the ability to perceive and process ongoing events in light of past experiences, future options, and current circumstances; sometimes used interchangeably with consciousness.

sensory aphasia Organic loss of ability to comprehend the meaning of words; fluid and spontaneous, but incoherent and nonsensical, speech. *See also* fluent aphasia and receptive aphasia.

sensory deprivation Lack of external stimuli and the opportunity for the usual perceptions; may be produced experimentally or may occur in real-life contexts (e.g., deep-sea diving, solitary confinement, loss of hearing or eyesight), leading to hallucinations, panic, delusions, and disorganized thinking. *See also* emotional deprivation.

sensory extinction Neurologic sign operationally defined as failure to report one of two simultaneously presented sensory stimuli, despite the fact that either stimulus alone is correctly reported. Also called sensory inattention.

sensory inattention SENSORY EXTINCTION.

Sentence Completion Test (SCT) Test designed to tap patients' conscious associations to areas of functioning in which the clinician may be interested; it is composed of a series (usually 75 to 100) of sentence stems, such as "I like….," "Sometimes I wish…," that patients are asked to complete in their own words.

separation anxiety Reaction expressed in a child who is isolated or separated from the mother, such as tearfulness, irritability.

separation anxiety disorder In DSM, an anxiety disorder characterized by an infant's or child's fear and apprehension on being removed from the parent or parent figure.

separation–individuation As elaborated by Margaret Mahler, the phase during which the child perceives itself as distinct from the mother; as the child separates, it becomes more independent and aware of its physical and psychological autonomy and can endure separation from the mother.

serotonin 5-Hydroxytryptamine (5-HT), an endogenous indolamines synthesized from dietary tryptophan and found in the

Telegram: @medical_k

www.konkur.in

gastrointestinal tract, the platelets, and the central nervous system. Evidence indicates that this monoamine serves as a neurotransmitter substance in the central nervous system and may play an important role in such diverse functions as sleep, sexual behavior, aggressiveness, motor activity, perception (particularly pain), and mood; dysfunction in central serotonergic systems has been proposed as a cause or factor in various mental disorders, including schizophrenia and the mood disorders.

serotonin-dopamine antagonists (SDAs) Drugs that block the receptors for both serotonin and dopamine in the brain. Also known as second-generation or atypical antipsychotics. *Compare* dopamine-receptor antagonists.

serotonin-norepinephrine reuptake inhibitors (SNRIs) Drugs that inhibit the reuptake of both serotonin and norepinephrine in the brain.

serotonin syndrome An excess of serotonin in the brain that causes a syndrome of confusion, delirium, tremor, and hyperthermia which may be fatal. Caused by overdose of serotonergic drugs.

serum levels *See* blood serum levels.

severe mental retardation *See* mental retardation.

sexual aberration Deviation from usual sexual practices. For types of sexual aberrations, see the specific term.

sexual arousal disorders Sexual dysfunction characterized by an inability to achieve a degree of sexual excitement sufficient to engage in coitus. Formerly called inhibited sexual excitement.

sexual aversion disorder Sexual desire disorder characterized by a disgust and/or avoidance of genital contact with a sexual partner.

sexual delusion Delusion centering on sexual identity, appearances, practices, or ideas.

sexual desire disorder Dysfunction characterized by a diminished or hypoactive sexual drive. Formerly called inhibited sexual desire. *See also* hypoactive sexual desire disorder; sexual aversion disorder.

sexual deviation PARAPHILIA.

Telegram: @medical_k

www.konkur.in

sexual drive One of the two primal drives or instincts (the other is the aggressive drive) in Freud's dual-instinct psychoanalytic theory. It operates under the pleasure–unpleasure (pleasure–pain) principle, with its main goal being the preservation and maintenance of life, in contrast to the aggressive drive that follows the repetition–compulsion principle; its unconscious psychic energy is known as libido. Also known as life instinct; Eros.

sexual dysfunction Class of sexual disorders characterized by inhibitions in sexual desire or the psychophysiologic changes that characterize the sexual response cycle.

sexual identity Biologically determined sexual state. *Compare* gender identity.

sexualization Endowment of an object or function with a sexual significance that it previously did not have, or possessed to a lesser degree, in order to ward off anxieties associated with prohibited impulses or their derivatives.

sexual masochism *See* masochism.

sexual orientation distress Term that refers to a disorder characterized by persistent and marked distress about one's sexual orientation; most often characterized by a desire to acquire heterosexual rather than homosexual arousal.

sexual pain disorders Sexual dysfunction characterized by pain during coitus, such as dyspareunia and vaginismus.

sexual reassignment *See* transsexualism.

sexual sadism *See* sadism.

shaman Healer in a primitive tribe who uses supernatural or spiritual powers to cure the sick.

shame Failure to live up to self-expectation; often associated with fantasy of how person will be seen by others. *See also* guilt.

shaping Operant conditioning technique, used in behavior therapy, in which a behavioral goal is reached in stepwise fashion through selective reinforcement of closer and closer approximations of the desired behavior.

shared paranoid disorder *See* shared psychotic disorder.

shared psychotic disorder Rare disorder in which the delusion system of the patient has developed out of a close relationship

Telegram: @medical_k

www.konkur.in

with another person who had a previously established, similar delusional system. In DSM-5, this condition is called “delusional symptoms in partner of individual with delusional disorder.” It has historically been referred to as shared paranoid disorder, induced psychotic disorder, folie à deux, and double insanity.

shell shock Obsolete World War I term for an acute mental disorder arising as a consequence of combat experience. *See* posttraumatic stress disorder.

shift work circadian rhythm disorder Characterized by sleep pattern disruptions that result from night shift work; associated with insomnia, excessive sleepiness, or both.

shock treatment Obsolete term for convulsive therapy.

short-duration depressive episode A DSM-5 diagnosis characterized by depressed mood lasting between 4 and 14 days that is nonrecurring.

short-term memory Reproduction, recognition, or recall of perceived material within seconds to minutes after the initial presentation. Compare immediate memory; long-term memory.

shyness disorder AVOIDANT DISORDER OF CHILDHOOD OR ADOLESCENCE.

sibling One of two or more individuals having one common parent.

sibling rivalry Competition among siblings for the attention, affection, and esteem of their parents or for other recognition or reward.

sick role Use of illness or complaints about bodily functioning as a means of escaping personal failure and the expectation to succeed, or as a way of avoiding other social responsibilities. *See also* hypochondriasis.

side effect Action of a drug other than the desired therapeutic effect.

sign Objective evidence of a disease or disorder. *Compare* symptom.

signal anxiety Sigmund Freud’s term describing a type of anxiety characteristic of the psychoneuroses, in which a child learns to anticipate and react to the possibility of a traumatic situation before it becomes traumatic.

significant differences *See* statistical significance.

Telegram: @medical_k

www.konkur.in

simple phobia Phobic disorder characterized by fear and avoidance of an object or situation not included in agoraphobia or social phobia.

simultanagnosia Impairment in the perception or integration of visual stimuli appearing simultaneously.

sitophobia Abnormal fear of eating.

skin-picking disorder *See* excoriation disorder.

Skinner, B. F. (1904–1990) American behavioral psychologist and author noted for his work on operant conditioning.

sleep Recurrent temporary period of relative unconsciousness, characterized by a reversible cessation of waking. Sensorimotor activity is accompanied by characteristic electroencephalographic changes; divided into REM (rapid eye movement) and non-REM (NREM) sleep.

sleep disorder Abnormality of the sleep–wake cycle. Sleep disorders include dyssomnias (insomnia disorder, primary insomnia, hypersomnia disorder, sleep–wake schedule disorder) and parasomnias (dream anxiety disorder, sleepwalking disorder, sleep terror disorder).

sleep-related eating disorder Sleep disorder characterized by the inability to fall back asleep after awakening without having something to eat or drink; predominantly affects infants and children.

sleep-related hallucinations Hallucinations that occur at sleep onset (hypnagogic) or on awakening (hypnopompic); hallucinations are often visual and common in patients with narcolepsy.

sleep-related hypoventilation Dyssomnia characterized by recurrent episodes of shallow breathing during sleep associated with insomnia and/or frequent arousal during the breathing disturbances. *See also* breathing-related sleep disorders.

sleep terror disorder Sleep disorder in which there are repeated episodes of abrupt awakenings from sleep, usually beginning with a panicky scream; characterized by verbalizations, confusion, autonomic activity, and poor recall of the dream. A non-REM sleep

Telegram: @medical_k

www.konkur.in

arousal disorder in DSM-5; also called pavor nocturnus; night terror. *See also* parasomnias.

sleep–wake schedule disorder Sleep disorder in which persons cannot sleep when they wish to sleep, but are able to sleep at other times; correspondingly, they cannot be fully awake when they want to be fully awake, but they are able to be awake at other times. Term used in ICD.

sleepwalking disorder DSM-5 term for somnambulism; a non-REM sleep arousal disorder. *See also* parasomnias.

slow-wave sleep (SWS) Non-REM sleep stages 3 and 4; so termed because of the characteristic wave appearance on the electroencephalogram (EEG) record. Also called delta sleep.

SNRI Serotonin-norepinephrine reuptake inhibitor.

social adaptation Adjustment to the whole complex of interpersonal relationships; the ability to live and express oneself in accordance with society's restrictions and cultural demands. *See also* adaptational approach.

social anxiety disorder *See* social phobia.

social breakdown syndrome Signs and symptoms indicating that the long-term institutionalization of a mental patient has itself contributed to the patient's symptoms; for example, development of progressive social and vocational incompetence, excessive passivity, and learning the chronic sick role.

social control Influence exerted on a person or a group of persons to conform to the demands or expectations of a society or any of its representative institutions, agencies, or organizations.

social instinct *See* herd instinct.

socialization Process through which an individual becomes a competent member of society; the condition in which inner impulses, that is, instincts, are expressed in conformity with cultural demands of the environment.

social learning theory Approach to behavior therapy that incorporates the elements of respondent and operant conditioning, but views cognitive processes as important mediators in such learning; relies on role modeling, identification, and human interactions.

Telegram: @medical_k

www.konkur.in

social network therapy Type of therapy in which the therapist assembles all persons (relatives, friends, social relations, work relations) who have emotional or functional significance in the patient's life to provide feedback and support to the patient; all or some of the social network may be assembled at any given time. *See also* extended-family therapy.

social phobia Any of a variety of phobic disorders characterized by a fear of being observed by others (e.g., fear of public-speaking, blushing, eating in public, writing in front of others, using public lavatories). Also called social anxiety disorder. DSM-5 includes a "performance only" diagnostic category if the fear is limited to speaking or performing in public.

social psychiatry Branch of psychiatry concerned with ecologic, sociologic, and cultural variables that engender, intensify, or complicate maladaptive patterns of behavior and their treatment.

social (pragmatic) communication disorder Persistent failure to use verbal and nonverbal communication for social purposes; differentiated from Autism Spectrum Disorder

social therapy Rehabilitation therapy used with psychiatric patients to improve social functioning; for example, occupational therapy, therapeutic community, recreational therapy, milieu therapy, attitude therapy.

sociobiology Systematic study of the biologic basis of social behavior, pioneered by E. O. Wilson.

sociology Scientific study of group behavior and social organization.

sociometry Study and measurement of the interpersonal psychological structure of a group or society.

sociopath Obsolete term for a person with an antisocial personality disorder.

sociopathic behavior Former term for antisocial behavior.

sociotherapy Any treatment modality whose primary emphasis is on socioenvironmental and interpersonal factors; for example, the therapeutic community.

sodomy Anal intercourse. Legally, the term may include other sexual deviations as well, such as bestiality.

Telegram: @medical_k

www.konkur.in

soldier's heart DA COSTA SYNDROME.

soma The body.

somatic delusion Delusion pertaining to the functioning of one's body.

somatic hallucination Hallucination involving the perception of a physical experience localized within the body.

somatic therapy Treatment of psychiatric disorders with biologic, organic, or physical treatments.

somatic symptom disorder Disorder characterized by multiple, recurrent physical complaints with no apparent physical cause and a preoccupation with the false belief of having a serious disease; symptoms have no demonstrable organic findings, are often misinterpreted by the patient, and are apparently linked to psychological factors. Previously called somatization disorder; also known as hypochondriasis; Briquet syndrome.

somatization disorder Somatoform disorder characterized by recurrent and multiple physical complaints with apparent physical cause; now called somatic symptom disorder in DSM-5. Also called Briquet syndrome.

somatoform disorders Term previously used for a group of mental disorders characterized by a marked preoccupation with the body and fears of disease; production of the symptoms is linked to psychological factors or conflicts but is not under voluntary control. Previously in DSM-IV, somatoform disorders included somatization disorder, conversion disorder, body dysmorphic disorder, and somatoform pain disorder. This group of disorders is now referred to as somatic symptom and related disorders. *See also* factitious disorder; malingering.

somatopagnosia Inability to recognize a part of one's body as one's own (also called ignorance of the body and autotopagnosia).

somatotype Physical build and structure of a person; one's physique.

somnambulism Repeated episodes of arising from bed during sleep, usually during the first third of the night during non-REM (stages 3 and 4 sleep); on awakening, the person has amnesia for

Telegram: @medical_k

www.konkur.in

the episodes. More frequently seen in males than in females, most commonly in children, who generally outgrow it; in adults, often associated with other psychiatric disturbances, such as schizoid personality disorder and schizophrenia.

somnolence Pathologic sleepiness or drowsiness from which one can be aroused to a normal state of consciousness.

spatial agnosia Inability to recognize spatial relations.

speaking in tongues Expression of revelatory message through unintelligible words; not considered a disorder of thought if associated with practices of specific Pentecostal religions. *See also* glossolalia.

specific developmental disorder *See* specific learning disorder.

specific learning disorders A class of neurodevelopmental disorders beginning in early childhood that are characterized by persistent difficulty or delays in learning skills in reading, written expression, and/or mathematics, which are inconsistent with the overall intelligence of the child. Specific learning deficit is indicated by the phrase, “with impairment in,” either reading (dyslexia), written expression, or mathematics (dyscalculia). Previously called specific developmental disorder. *Compare* pervasive developmental disorder.

specificity In research, the probability of a negative test result in one who does not have the disorder.

specific reading disability DEVELOPMENTAL READING DISORDER.

speech disturbance Any of a variety of language and communication disorders not due to impaired function of speech muscles or organs of articulation.

speech sound disorder Language or speech disorder in which there is a consistent failure to correctly articulate a speech sound at the developmentally appropriate age in the absence of any underlying anatomical, physiologic, auditory, or neurologic abnormalities. Also called developmental articulation disorder, functional speech disorder, infantile perseveration, infantile articulation disorder, and phonologic disorder.

Telegram: @medical_k

www.konkur.in

splitting Defense mechanism in which external objects are divided into “all good” and “all bad,” accompanied by the abrupt shifting of an object from one extreme category to the other.

SSRI Selective serotonin reuptake inhibitor.

stammering STUTTERING.

standard deviation (SD) Statistical measure of variability within a set of values so defined that, for a normal distribution, about 68% of the values fall within one SD of the mean, and about 95% lie within two SDs of the mean; sometimes represented by the Greek letter sigma (σ).

standard error of the mean (SEM) Statistical measure of how variable, that is, how reliable, a mean value calculated on the basis of a given sample is as an estimate of the mean of the population from which the sample was selected; obtained by dividing the standard deviation of the population by the square root of the number of measures in the sample.

standardized score Deviation of a score from its group mean expressed in standard deviation units. Also called z-score.

Stanford–Binet Intelligence Scale Primarily a verbal test of intellectual functioning, administered individually to children and adults, which emphasizes problem solving; one of the most widely used IQ tests.

startle reaction Reflex response to a sudden intense stimulus, consisting of a diffuse motor response involving flexion movements of the trunk and extremities and associated with a sudden increase in alertness; occurs in normal persons and in anxiety disorders.

state-dependent learning or memory Facilitated recall of information when one is in the same internal state (e.g., drug state) or external environment that the information was first acquired.

statistical inference Research term used to make a general statement about a study based on a small group or to decide whether to attribute differences between two groups to chance or to nonchance factors.

Telegram: @medical_k

www.konkur.in

statistical significance Research term referring to an experimental result, based on a sample of observations, which demonstrates an outcome or effect of sufficient magnitude such that the probability of that result being due to chance alone is less than 5%. *See also* Type I error.

status epilepticus Continuous epileptic seizures. *See also* epilepsy.

stereotypy Continuous mechanical repetition of speech or physical activities; observed in cases of catatonic schizophrenia.

stereotypy and habit disorder *See* stereotypic movement disorder.

stereotypic movement disorder Motor disorder consisting of intentional, repetitive, and typically rhythmic behaviors that are nonfunctional, that is, serve no constructive, socially acceptable purpose (e.g., hand flapping, body-rocking, head-banging, face-slapping, skin picking). Movements appear self-soothing or self-stimulating, but in certain cases may also result in self-injury.

stilted speech Excessively formal, stiff, stylized, or pompous speech; overly polite, distant, or antiquated speech.

stimulant Drug that stimulates the central nervous system to produce increased psychomotor activity; for example, methylphenidate (Ritalin), caffeine, amphetamines.

stimulus Any event, internal or external to the person, which elicits some kind of nervous system activity or response.

Stockholm syndrome Syndrome in which captives identify with, and have sympathy for, their captors on whom they are dependent for survival; seen in terrorist–hostage situations. The major defense mechanism, as described by Anna Freud, was known as identification with the aggressor.

STP Slang name for 2,5-dimethoxy-4-methylamphetamine.

street drugs Readily available, illegally acquired psychoactive substances; for example, marijuana, heroin, cocaine, crack.

strephosymbolia Reading and writing disability characterized by confusion between similarly formed but oppositely oriented letters (as in b and d, p and q), with tendency to reverse the order of letters and words.

stress Circumstance in a person's life that causes tension or dysphoria. Stressors may be mild (e.g., termination of a friendship)

Telegram: @medical_k

www.konkur.in

or catastrophic (e.g., suicide of a spouse). DSM contains a Severity of Psychosocial Stressor Scale for children, adolescents, and adults. Also called psychosocial stressor.

stress immunity Failure to react to emotional stress.

stress reaction Disturbed psychological or physiologic functioning encountered when strong, involuntary, often unconscious internal impulses press for action that conflict with one's conscious, reality-oriented behavior.

stroke CEREBROVASCULAR ACCIDENT.

structured interactional group psychotherapy Group therapy developed by Harold Kaplan and Benjamin Sadock, in which the therapist provides a structural matrix for the group's interactions, the most important of which is that a different member of the group is the focus of the interaction in each session.

structured interview 1. Interview in which the same questions are asked of all patients. **2.** Interview in which the interviewer asks specific questions about specific topics.

Studies on Hysteria Title of a book by Josef Breuer and Sigmund Freud (1895) that described the cathartic method of treatment and the beginnings of psychoanalysis; demonstrated the psychological origins of hysterical symptoms and the possibility of effecting a cure through psychotherapy.

stupor 1. State of decreased reactivity to stimuli and less than full awareness of one's surroundings; as a disturbance of consciousness, it indicates a condition of partial coma or semi coma. **2.** In psychiatry used synonymously with mutism and does not necessarily imply a disturbance of consciousness; in catatonic stupor, patients are ordinarily well aware of their surroundings.

stuttering Speech disorder characterized by repetitions or prolongations of sounds, syllables, or words, or by unusual hesitations and pauses that disrupt the normal flow of speech. May often be associated with habitual eye blinking, facial grimacing, head jerks, or abnormal body movements. Also called stammering; child-onset fluency disorder.

subcoma therapy *See* insulin coma therapy.

Telegram: @medical_k

www.konkur.in

subconscious
Obsolete term for the preconscious and the unconscious.

subjectivity State in which evaluation and interpretation are influenced by one's own feelings and thinking.

sublimation Unconscious defense mechanism in which the energy associated with unacceptable impulses or drives is diverted into personally and socially acceptable channels; unlike other defense mechanisms, it offers some minimal gratification of the instinctual drive or impulse.

substance abuse Called substance use disorder in DSM-5; diagnosed according to the substance used, for example, alcohol, cocaine, cannabis, hallucinogens, inhalants, opioids, sedatives, stimulants, or tobacco. *See also* drug abuse.

substance use disorder A maladaptive pattern of substance use leading to impairments in functioning characterized by the substance being used in larger amounts over time; unsuccessful efforts to cut down use; cravings; and symptoms of tolerance and withdrawals.

substance withdrawal Cessation or reduction of intake of a substance regularly used to induce a state of intoxication.

substitution Unconscious defense mechanism in which a person replaces an unacceptable wish, drive, emotion, or goal with one that is more acceptable.

succinylcholine Powerful skeletal muscle relaxant used in anesthesia and as a muscle relaxant in electroconvulsive treatment.

suggestibility State of uncritical compliance with influence or of uncritical acceptance of an idea, belief, or attitude; commonly observed among persons with hysterical traits.

suggestion Process of influencing a person to the point of uncritical acceptance of an idea, belief, or other cognitive process.

suicidal ideation Thoughts or acts of taking one's own life.

suicide Act of taking one's own life. Although the underlying factors that lead a person to take their own life may not necessarily be fully understood by that person, the act of suicide is considered to be both voluntary and intentional.

Telegram: @medical_k

www.konkur.in

suicide cluster *See* cluster suicide.

Sullivan, Harry Stack (1892–1949) American psychiatrist and psychoanalyst best known for his interpersonal theory of psychiatry.

sundowner's syndrome SUNDOWNING.

sundowning Syndrome in the older adults that usually occurs at night and is characterized by drowsiness, confusion, ataxia, and falling as the result of being overly sedated with medications. Also called sundowner's syndrome.

superego One of the three components of the psychic apparatus in the freudian structural framework, the others being the ego and id. It represents the internalized values, ideals, and moral attitudes of society and has psychic functions that are expressed in guilt, self-criticism, and conscience. It develops through the child's identification with his parents, and the severity of its prohibitions or demands is said to be related to the intensity and extent of resolution of the Oedipus complex. *See also* conscience.

supportive psychotherapy Psychotherapy that seeks to strengthen patients' defenses and to provide them with reassurance, rather than to probe deeply into their conflicts.

suppression Conscious act of controlling and inhibiting an unacceptable impulse, emotion, or idea; differentiated from repression in that repression is an unconscious process.

surrogate One who takes the place of another; a substitute.

susto Culture-specific mental syndrome seen in Latin America; characterized by an intense fear of evil supernatural forces.

SWS Slow-wave sleep.

symbiosis Dependent, mutually reinforcing relationship between two persons. Generally a normal, constructive characteristic of the infant–mother relationship, it can also occur in a destructive context, as between two mentally ill persons who reinforce each other's pathology or in a mother–infant relationship that induces in the child an intense separation anxiety, autism, and severe regression (symbiotic psychosis).

Telegram: @medical_k

www.konkur.in

symbiotic psychosis Disorder in children characterized by an inability to separate psychologically or physically from the mother; such children experience confusion, intense separation anxiety, and an inability to function.

symbolization Unconscious defense mechanism in which one idea or object comes to stand for another because of some common aspect or quality in both; based on similarity and association; the symbols formed protect the person from the anxiety that may be attached to the original idea or object.

sympathetic nervous system The part of the autonomic nervous system innervating the viscera by outflow from thoracolumbar segments of the spinal cord. Its physiologic effects (e.g., tachycardia, peripheral vasoconstriction, pupillary dilation, decreased bowel motility) are predominantly adrenergic, and they characterize the fight-or-flight reaction that occurs in response to dangerous or threatening situations.

sympathomimetic drug Drug whose effects mimic the responses to stimulation of the sympathetic nervous system; for example, amphetamine, epinephrine.

sympathy Compassion for or sharing of another person's feelings, ideas, and experiences. *Compare* empathy.

symptom Any abnormality indicative of a mental or physical disorder experienced by the patient but not observable by a physician. *Compare* sign.

symptomatic psychosis Brain dysfunction as a result of some general physical disease, the most common feature of which is a delirious state; may occur in the course of an acute infectious disease, such as pneumonia, influenza, or pelvic infections following childbirth.

symptom formation Unconscious psychic process in which a repressed impulse is indirectly released and manifested through a symptom; may be regarded as a kind of compromise reflecting a partial satisfaction of both the forbidden impulse and the ego reaction against it.

symptom substitution Phenomenon in which a set of symptoms that are removed directly in therapy, without regard for the

Telegram: @medical_k

www.konkur.in

unconscious conflicts responsible for their formation, are replaced by new symptoms. It has constituted a theoretical objection to such modalities as behavior therapy and hypnotherapy.

synapse Specialized structure at which one neuron makes contacts with the receptor elements in the adjacent neuron.

syncretic thought Jean Piaget's term for the prelogic, egocentric, solipsistic thinking that characterizes early childhood mentation. *See also* primary process.

synesthesia Condition in which the stimulation of one sensory modality is perceived as sensation in a different modality, as when a sound produces a sensation of color.

syphilis A chronic bacterial disease caused by the spirochete *Treponema pallidum* (*T. pallidum*). Associated with delirium, dementia, mania, psychosis, personality change, and depression.

syntactical (central) aphasia Aphasia characterized by difficulty in understanding spoken speech, associated with gross disorder of thought and expression.

syntaxic mode of experience Harry Stack Sullivan's term denoting the highest level of interpersonal communication, which is based entirely on reality and which is considered the desirable outcome of healthy development. *See also* secondary process.

syntropy Adolf Meyer's term characterizing healthy or wholesome relationships.

systematic desensitization Form of behavior therapy developed by Joseph Wolpe and others in which anxiety-evoking stimuli are represented to a patient in a state of deep muscle relaxation in an attempt to weaken the bond between the stimuli and the anxiety; particularly useful in the treatment of phobias. *See also* reciprocal inhibition and desensitization.

systematized delusion Group of elaborate delusions related to a single event or theme.

T

taboo Restrictions or prohibitions on behavior imposed by a culture, usually involving a dangerous, forbidden, or unclean entity.

Telegram: @medical_k

www.konkur.in

tachylogia LOGORRHEA.

tactile amnesia *See* neurologic amnesia.

tactile hallucination Hallucination primarily involving the sense of touch. Also called haptic hallucination.

talion Retaliation; the fear that all bad deeds, intentional or accidental, will be punished in kind; that is, an eye for an eye and a tooth for a tooth. In psychoanalysis, the fear of castration or punishment for oedipal strivings, as in the Oedipus complex.

tangentiality Disturbance in which the person replies to a question in an oblique, digressive, or even irrelevant manner and the central idea is not communicated; failure to communicate the central idea distinguishes tangentiality from circumstantiality, in which the goal idea is reached in a delayed or indirect manner. The term has also been used synonymously with loosening of associations and speech derailment.

taphophobia Abnormal fear of being buried alive.

Tarasoff decision California Supreme Court decision that a physician or psychotherapist who has reason to believe that a patient may injure or kill someone must notify the potential victim, their relatives or friends, or the authorities.

tardive dyskinesia Late-appearing extrapyramidal syndrome associated with antipsychotic drug use and characterized by stereotyped involuntary movements of the lips, jaw, and tongue (tardive oral dyskinesia) and by other involuntary dyskinetic movements; symptoms may remit eventually or persist indefinitely after discontinuation of the medication, and the condition does not respond to treatment with antiparkinsonism drugs.

TAT Thematic Apperception Test.

telepathy Extrasensory perception of the mental activities of another person.

telepsychiatry Psychiatric practice using the electronic transmission of images.

temperament Inherent, constitutional predisposition to react, in a certain way to stimuli; variations in temperament are evident very early in life.

Telegram: @medical_k

www.konkur.in

temporal lobe epilepsy COMPLEX PARTIAL SEIZURE.

temporary admission Hospitalization in which a person is admitted on the recommendation of one physician (which must be confirmed by a psychiatrist, upon admittance), for no more than 15 days if against their will; applies to patients who are so senile or confused that they require hospitalization and are notable to make decisions on their own, or so acutely disturbed that they must be immediately admitted to a psychiatric hospital on an emergency basis.

tension Physiologic or psychic arousal, uneasiness, or pressure toward action; an unpleasurable alteration in mental or physical state that seeks relief through action.

terminal insomnia Early morning awakening or waking up at least 2 hours before planning to. *Compare* initial insomnia; middle insomnia.

terrorism The use or threat of violence to instill fear with the intent to intimidate or coerce governments or societies in the pursuit of political, religious, or idealogic goals.

tertiary prevention *See* preventive psychiatry.

testamentary capacity One's competency to make a will. Three psychological abilities are necessary to demonstrate this competency: (1) the nature and extent of their bounty (property); (2) that they are making a will; and (3) who their natural beneficiaries are, for example, their spouse, children, and other relatives.

testimonial privilege Right to maintain secrecy or confidentiality in the face of a subpoena. Privilege belongs to the patient, not to the physician.

test of significance Statistical test used to determine whether a difference in the data obtained is due to chance or is meaningfully related to some specific factor or variable (statistically significant).

tetrahydrocannabinol (THC) Chemical substance produced by the Indian hemp plant (*Cannabis sativa*), believed to be responsible for most of the characteristic psychological effects of marijuana. Street drugs alleged to be THC frequently contain phencyclidine

Telegram: @medical_k

www.konkur.in

(PCP), a veterinary tranquilizer that may produce extreme excitement, visual disturbances, and delirium.

T (training)-group Group that emphasizes training in self-awareness and group dynamics.

thanatology Study of death and matters leading up to and following it.

thanatophobia Abnormal fear of death.

Thanatos A term used by Freud to refer to the death instinct. *Compare* eros.

THC Tetrahydrocannabinol.

Thematic Apperception Test (TAT) Projective psychological test in which subjects supply interpretations of a series of ambiguous life situation drawings, based on their own feelings and attitudes and reflecting their unconscious conflicts and defensive structures.

theory Plausible or scientifically acceptable general principle or body of principles offered to explain phenomena.

therapeutic agent Anything that promotes healing, such as a substance, person, or apparatus.

therapeutic alliance Conscious contractual relationship between therapist and patient in which each implicitly agrees that they need to work together to help the patient with their problems; involves a therapeutic splitting of the patient's ego into observing and experiencing parts. A good therapeutic alliance is especially necessary for the continuation of treatment during phases of strong negative transference.

therapeutic atmosphere All therapeutic, maturational, and growth-supporting agents, that is, cultural, social, and medical.

therapeutic community Institutional treatment setting designed with an emphasis on the importance of socioenvironmental and interpersonal influences in the therapy, management, and rehabilitation of the hospitalized mental patient. *See also* milieu therapy.

therapeutic group Group of patients joined together under the leadership of a therapist for the purpose of working together for psychotherapeutic ends; specifically, for the treatment of each patient's mental disorders.

Telegram: @medical_k

www.konkur.in

therapeutic role Position in which one aims to treat, bring about an improvement, or provide alleviation of a distressing condition or state.

therapeutic window Range of blood plasma levels of a drug within which optimal therapeutic effects occur, based on such factors as age, sex, race, genetic makeup, and concurrent medications.

therapist *See* psychotherapist.

tetracyclic antidepressants One group of antidepressant drugs so named because of their four-ringed structure. *See also* tricyclic antidepressants.

thinking *See* cognition.

thinking compulsion INTELLECTUALIZATION.

thioxanthene derivative One of a class of antipsychotic drugs closely related, both structurally and pharmacologically, to the phenothiazines; for example, chlorprothixene (Taractan), thiothixene (Navane).

third ear Ability to make use of intuition, sensitivity, and awareness of subliminal cues to interpret clinical observations of individual and group patients; a term introduced by the German philosopher Friedrich Nietzsche and later used in analytic psychotherapy by Theodor Reik.

third-party payer Health or medical care insurer.

thought broadcasting Feeling that one's thoughts are being broadcast or projected into the environment. *See also* thought withdrawal.

thought control *See* delusion of control.

thought deprivation BLOCKING.

thought disorder Any disturbance of thinking that affects language, communication, or thought content; the hallmark feature of schizophrenia. Manifestations range from simple blocking and mild circumstantiality to profound loosening of associations, incoherence, and delusions; characterized by a failure to follow semantic and syntactic rules which is inconsistent with the person's education, intelligence, or cultural background.

Telegram: @medical_k

www.konkur.in

thought insertion Delusion that thoughts are being implanted in one's mind by other people or forces.

thought latency The period of time between a thought and its verbal expression. Increased in schizophrenia (*see* blocking) and decreased in mania (*see* pressured speech).

thought process disorder Symptom of schizophrenia, involving the intellectual functions, manifested by irrelevance and incoherence of verbal productions; ranges from simple blocking and mild circumstantiality to total loosening of associations, as in word salad.

thought withdrawal Delusion that one's thoughts are being removed from one's mind by other people or forces. *See also* thought broadcasting.

three-cornered therapy CO-THERAPY.

Three Essays on the Theory of Sexuality Title of a book by Sigmund Freud (1905) in which the libido theory was applied to the successive phases of psychosexual maturation in the infant, child, and adolescent; made possible the integration of a vast diversity of clinical observations and promoted the direct observation of child development.

Tic Seemingly involuntary sudden, brief, and rapid motor movements or vocalizations stimulated by an irresistible internal urge. Common motor tics include eye blinking, head-jerking, and grimacing; common vocal tics include coughing, throat-clearing, and grunting. Tics may have symbolic meaning. *See also* Tourette disorder.

tic disorders Predominately psychogenic class of motor disorders consisting of involuntary, spasmodic, stereotyped movements of a small group of muscles or vocal sounds; seen prominently in moments of stress or anxiety, and rarely as a result of organic disease. The two types of tic disorder in DSM-5 include Tourette disorder and persistent chronic motor or vocal tic disorders.

timidity Inability to assert oneself for fear of some fancied reprisal, even in the absence of objective evidence of potential harm.

Telegram: @medical_k

www.konkur.in

tinnitus Noises in one or both ears, such as ringing, buzzing, or clicking; a rare side effect of some tricyclic antidepressant drugs.

TMS Transcranial magnetic stimulation.

tobacco dependence *See* nicotine dependence.

toilet training Program of teaching a child to control bladder and bowel functions; attitudes of both parent and child during the period may have important psychological implications for the child's later development.

token economy Program applying principles of operant conditioning to the management of an institutional setting, such as a ward or a classroom, during which reinforcement of desirable behavior is provided in the form of tokens or credits (conditioned reinforcers) that may be exchanged for a variety of positive reinforcers, such as food, television time, or a weekend pass.

tolerance Phenomenon in which, after repeated administration, a given dose of a drug produces a decreased effect or increasingly larger doses must be administered to obtain the effect observed with the original dose. *Compare* drug dependence.

tomography *See* computed tomography; positron emission tomography.

tonic convulsion Convulsion in which the muscle contraction is sustained.

topectomy Psychosurgical procedure involving ablation of a small and specific area of the frontal cortex for the treatment of a chronic psychotic patient.

torture The intentional infliction of physical and psychological suffering with the intent to gain information or to intimidate individuals or communities.

Totem and Taboo Title of a book by Sigmund Freud (1913) in which he applied his psychoanalytic concepts to the data of anthropology. He was able to afford much insight into the meaning of tribal organizations and customs, especially by invoking the Oedipus complex and the characteristics of magical thought as discovered from his studies of the unconscious.

Tourette syndrome Rare motor disorder, first described by a Paris physician, Gilles de la Tourette, that has its onset in childhood and

Telegram: @medical_k

www.konkur.in

is characterized by multiple involuntary muscle movements (tics), motor incoordination, and the presence of at least one vocal tic, such as echolalia and coprolalia.

toxicity State of being poisonous.

toxic psychosis Psychosis caused by toxic substances produced by the body or introduced into it in the form of chemicals or drugs.

toxophobia Abnormal fear of being poisoned.

trailing phenomenon Perceptual abnormality associated with hallucinogenic drugs in which moving objects are seen as a series of discrete and discontinuous images.

trainable Capable of achieving a certain degree of self-care and social adjustment at home and vocational usefulness in a closed supervised setting; describes the moderately mentally retarded (IQ of 35–40 to 50–55). *Compare* educable.

training group *See* T-group.

trait Distinguishing quality as an observed or measured characteristic of an individual.

trance Sleep-like state of reduced consciousness and activity.

tranquilizer Psychotropic drug that induces tranquility by decreasing anxiety or agitation, usually without clouding consciousness; formerly classified as major and minor tranquilizers which are now called antipsychotic and antianxiety agents, respectively.

transactional analysis Eric Berne's system of psychodynamic psychotherapy that focuses on the interactions (transactions) between the patient and the therapist in the treatment session and between the patient and others in a social environment; used in both individual and group psychotherapy. The system includes four components: (1) structural analysis of intrapsychic phenomena; (2) transactional analysis proper, the determination of the currently dominant ego state (parent, child, or adult) of each participant; (3) game analysis, identification of the games played in their interactions and of the gratifications provided; and (4) script analysis, uncovering of the causes of the patient's emotional problems.

transcranial magnetic stimulation (TMS) A form of brain stimulation in which a rapidly changing magnetic field is applied to

Telegram: @medical_k

www.konkur.in

the scalp to induce small, focused electrical currents in superficial cortex. Used for treatment-resistant depression.

transcultural psychiatry Branch of psychiatry concerned with the mental health of members of different cultures, that is, what may be considered normal for one culture may be unacceptable to another.

transference Unconscious tendency of a person to assign to others in the present and immediate environment those feelings and attitudes originally linked with significant figures in the person's early life, for example, identification of the therapist with a parent; the transference may be negative (hostile) or positive (affectionate). Analysis of transference phenomena is used as a major therapeutic tool in both individual therapy and group therapy to help patients better understand and gain insight into their behavior and its origins. *See also* countertransference; transference neurosis.

transference neurosis Phenomenon occurring in psychoanalysis in which the patient develops a strong emotional attachment to the therapist as a symbolized nuclear familial figure; repetition and the depth of that misperception or symbolization characterize it as a transference neurosis.

transsexualism Gender identity disorder in which a person has a desire to be of the opposite sex. Some transsexuals, many of whom have adopted the role of the opposite sex since childhood, have successfully undergone sex-changing surgical procedures, accompanied by intensive hormonal therapy and psychotherapy. *Compare* transvestism.

transvestism, transvestitism Paraphilia characterized by dressing in the clothing of the opposite sex for the purpose of sexual arousal; usually seen in men with a strong desire to appear as women. Also called cross dressing. *Compare* transsexualism.

trauma In psychiatry, a significant, upsetting experience or event that may precipitate or aggravate a mental disorder.

traumatic brain injury Damage to the structure of the brain caused by physical force that affects cognitive functioning with associated

Telegram: @medical_k

www.konkur.in

changes in mood and behavior. Most commonly associated with war injuries.

traumatic neurosis *See* posttraumatic stress disorder.

treated prevalence Number of persons being treated for a disorder in a defined geographic area.

tremor Rhythmical alteration in movement, which is usually faster than one beat a second; typically, tremors decrease during periods of relaxation and sleep and increase during periods of anger and increased tension.

trend of thought Thinking that centers on a particular idea associated with an affective tone.

triad Interactional relationship among three persons. Its prototype, the father–mother–child relationship, may evolve projectively in group therapy.

triadic therapy, triangular therapy CONJOINT THERAPY.

trichotillomania Compulsion to pull out one's hair.

tricyclic antidepressants One of a group of antidepressant drugs so named because of their three-ringed structure; currently the most widely used drugs for the treatment of depression, although anticholinergic side effects are prominent; for example, imipramine (Tofranil), amitriptyline (Elavil).

triskaidekaphobia The fear of the number 13.

trisomy Chromosomal aberration in which there are three chromosomes of one type instead of the usual two in an otherwise diploid cell, as in Down syndrome.

trisomy 21 syndrome DOWN SYNDROME.

true insight Understanding of the objective reality of a situation coupled with the motivational and emotional impetus to master the situation or change behavior.

t-test Statistical procedure designed to compare two sets of observations.

Tuke, William (1732–1822) British pioneer in the treatment of mental patients without the use of physical restraints.

Turner syndrome Disorder secondary to a chromosomal anomaly in which affected females typically have an XO sex chromosome

Telegram: @medical_k

www.konkur.in

constitution (instead of the usual XX) and a total of 45 chromosomes (instead of the usual 46). Classical somatic features include short stature, webbed neck, distinctive facies, sexual infantilism, and cubitus valgus. The incidence of mental retardation is not increased and severe psychopathic manifestations are uncommon, in contrast to the increased frequency of those disorders in XXY males. Also called ovarian dysgenesis; gonadal dysgenesis. *See also* Klinefelter syndrome.

twilight state Disturbed consciousness with hallucinations.

twin studies Studies that are useful in separating genetic and environmental influences and in looking for protective and precipitating factors.

twirling Sign present in autistic children who continually rotate in the direction in which their head is turned.

Type 1 error Research term referring to the rejection of the null hypothesis when it should have been retained. When the statistically calculated probability (*p* value) of making a Type 1 error on the basis of an experimental result is less than 0.05, the result is considered statistically significant; that type of error and the arbitrarily chosen 0.05 level of significance are sometimes called alpha (α) error. *Compare* Type 2 error.

Type 2 error Research term referring to the failure to reject a false null hypothesis, that is, concluding that any difference or effect demonstrated in an experiment is no greater than that expected by chance alone when, in fact, there is an actual difference or effect. Also called beta (β) error. *Compare* Type 1 error.

Type A personality As defined by Meyer Friedman and Ray Rosenman, cardiologists, an action-oriented individual who struggles to achieve poorly identifiable goals by means of competitive hostility; has increased amounts of low-density lipoprotein, serum cholesterol, triglycerides, and 17-hydroxycorticosteroids; and tends to develop coronary heart disease.

Type B personality As defined by Meyer Friedman and Ray Rosenman, cardiologists, a relaxed and less-aggressive individual (than Type A) who tends to strive less vigorously to achieve goals.

Telegram: @medical_k

www.konkur.in

tyramine Sympathomimetic amine that acts by displacing stored transmitter from adrenergic axonal terminals; its degradation is normally aided by monoamine oxidase (MAO). Ingestion of food containing tyramine (e.g., cheese, beer, wine, yeast) by a patient on MAO inhibitors can provoke a potentially fatal hypertensive crisis.

U

UCR Unconditioned response or reflex.

UCS Unconditioned stimulus.

ultradian rhythm *See* biologic rhythm.

ululation Incoherent crying of a psychotic or hysterical patient.

unconditioned response, unconditioned reflex (UCR) *See* conditioning.

unconditioned stimulus (UCS) *See* conditioning.

unconscious 1. One of three divisions of Sigmund Freud's topographic theory of the mind (the others being the conscious and preconscious) in which the psychic material is not readily accessible to conscious awareness by ordinary means; its existence may be manifested in symptom formation, in dreams, or under the influence of drugs. **2.** In popular but more ambiguous usage, any mental material not in the immediate field of awareness. **3.** Denoting a state of unawareness, with lack of response to external stimuli, as in a coma.

underachiever One who fails to perform at the level of their known potential or capability.

undersocialized Characterized by the absence of adequate social bonds to others, as a type of conduct disorder.

undifferentiated schizophrenia Type of schizophrenia with prominent psychotic symptoms that do not fall into the other schizophrenic subtypes; no longer included in DSM.

undoing Unconscious primitive defense mechanism, repetitive in nature, by which a person symbolically acts out in reverse something unacceptable that has already been done or against

Telegram: @medical_k

www.konkur.in

which the ego must defend itself; a form of magical expiatory action, commonly observed in obsessive-compulsive disorder.

unio mystica Feeling of mystic unity with an infinite power.

unipolar psychosis Mood disorder characterized by recurrent episodes of depression or, much more rarely, recurrent manic states. *Compare* bipolar disorder.

universality Total effect produced when all group therapy members share specific symptoms or problems.

unstructured interview 1. Interview in which the interviewer chooses questions based on clinical judgment. **2.** Interview in which questions are related to what the patient brings up spontaneously.

urolagnia Paraphilia in which sexual pleasure is derived from urinating on someone else, being urinated on, or drinking urine.

utilitarian principle In policy and ethical decisions, a choice that is determined by whatever promises the greatest advantage to the common good.

utilization review committee Hospital committee that reviews the quality of services rendered, with particular attention to the appropriate use of facilities.

V

vagina dentata Sigmund Freud's theory that an unconscious fantasy exists in certain persons who are afraid of women and who believe that there are "biting teeth" in the vagina.

vaginismus Painful vaginal spasms, usually psychogenic, that occur during coitus, causing dyspareunia; may have its onset during preparation for intercourse, making penile insertion impossible. *See also* Genito–pelvic pain/penetration disorder.

validity Degree to which a test measures what it claims to measure; the degree to which an experimental design yields data truly applicable to the phenomenon under investigation. *See also* reliability.

variable In research, any characteristic or factor that may assume different values. The terms "independent variable" and "dependent

Telegram: @medical_k

www.konkur.in

variable" indicate a relationship of cause and of effect, respectively.

variable-interval schedule *See* schedule of reinforcement.

variable-ratio schedule *See* schedule of reinforcement.

variance Statistical measure of the variability within a set of observations, defined as the sum of the squared deviations from the mean divided by the number of observations; it equals the standard deviation squared. *See also* analysis of variance.

variation Statistical term referring to the manner in which persons in a population vary among themselves with respect to a given quality or trait; variability of persons also affects the precision of sample estimates. Three common measures of variation are the range, the variance, and the standard deviation. Knowledge of variation in a population is important because it indicates how useful the mean value is as a representative figure.

vascular dementia A type of dementia in which a succession of strokes has led to a stepwise deterioration of intellectual functioning with associated focal neurologic signs and symptoms. Previously called multi-infarct dementia and currently called Major or Mild Vascular Neurocognitive Disorder in DSM-5-TR.

vegetative 1. Pertaining to autonomic functions that are largely physiologic or concerned with the growth, nutrition, or general physical health and homeostasis of the organism. **2.** In depression, denoting characteristic symptoms such as sleep disturbance (especially early morning awakening), decreased appetite, constipation, weight loss, and loss of sexual response.

vegetative nervous system Obsolete term for autonomic nervous system.

velocardiofacial syndrome A genetic disorder caused by a microdeletion in chromosome 22. Characterized by cleft palate, heart defects, immune dysfunction, mild intellectual disability, psychotic disorders, and mood disorders. Also called Shprintzen syndrome or DiGeorge syndrome.

verbal amnesia *See* neurologic amnesia.

verbigeration Meaningless and stereotyped repetition of words or phrases as seen in schizophrenia. Also called cataphasia. *See*

Telegram: @medical_k

www.konkur.in

also perseveration.

verbiomania LOGORRHEA.

vertigo Sensation that one or the world around one is spinning or revolving; a hallmark symptom of vestibular dysfunction, not to be confused with dizziness.

visceral learning *See* biofeedback; learned autonomic control.

visual agnosia Inability to recognize objects or persons.

visual amnesia *See* neurologic amnesia.

visual hallucination Hallucination primarily involving the sense of sight.

visual motor gestalt test BENDER-GESTALT TEST.

vitamin therapy *See* orthomolecular psychiatry.

voice disorder A communication disorder that is characterized by abnormalities in vocal quality, pitch, and volume.

volitional Self-initiated.

volubility LOGORRHEA.

voluntary admission Hospitalization in which patients apply in writing for admission to a psychiatric hospital and are admitted if psychiatric examination reveals such need.

voluntary control Deliberate bringing about of an activity or refraining from an activity. The person exercising the control is aware of the nature of the activities and of the end to be achieved.

volunteer bias Sampling bias of persons who volunteer to take part in an experiment; such persons are not truly representative of the population and may tend to skew the results of the study, for example, the subjects may be more cooperative.

von Domarus principle Theory proposed by Eilhard von Domarus (1946) to explain schizophrenic thinking, which is characterized by the idea that two things are identical merely because they have identical predicates or properties.

voyeurism Paraphilia in which sexual excitement, frequently with orgasm, is obtained by looking at others naked, disrobing, or engaging in sexual activity. Also called voyeuristic disorder. *Compare* scopophilia.

Telegram: @medical_k

www.konkur.in

W

WAIS Wechsler Adult Intelligence Scale.

Watson, John B. (1878–1958) American psychologist who used Ivan Pavlov's theory of classical conditioning to explain human behavior. *See also* Little Albert.

waxy flexibility Condition in which a person maintains the body position into which they are placed. Also called catalepsy.

Wechsler Adult Intelligence Scale (WAIS) Intelligence test that assesses intellectual functioning in adults.

Wechsler Intelligence Scale for Children (WISC) Intelligence test that assess intellectual functioning in children aged 5 to 15.

Wechsler Preschool and Primary Scale of Intelligence (WPPSI) Intelligence test that assesses intellectual functioning in children aged 4 to 6.

Wednesday Evening Society Small group of Sigmund Freud's followers who in 1902 started meeting with him informally on Wednesday evenings to receive instructions in psychoanalysis; as the society grew in numbers and importance, it evolved in 1910 into the Vienna Psychoanalytic Society.

weekend hospital Partial hospitalization in which the patient spends only weekends in the hospital and functions in the outside world during the week. *Compare* day hospital; night hospital.

Wernicke–Korsakoff syndrome Thiamine deficiency seen in Korsakoff psychosis (alcohol amnestic syndrome). Also called alcohol dementia. *See also* Wernicke fluent encephalopathy; Korsakoff psychosis.

Wernicke aphasia FLUENT APHASIA.

Wernicke fluent encephalopathy Neurologic disorder caused by nutritional deficiency of thiamine (vitamin B) as seen in chronic alcoholism, with hallmark clinical features of ophthalmoplegia, ataxia, and confusion; some patients show disorders of short-term memory and other cognitive functions characteristic of Korsakoff psychosis (alcohol amnestic disorder), which has come to be regarded as a more advanced and chronic stage of the same disease process. Wernicke encephalopathy responds dramatically

Telegram: @medical_k

www.konkur.in

to the administration of thiamine, which may also prevent progression into the largely irreversible Korsakoff psychosis.

Weyer, Johann (1515–1588) Dutch physician considered by some to be the first psychiatrist, whose interest in human behavior led to his writing *De Praestigiis Daemonum* (1563), a landmark in the history of psychiatry.

white-out syndrome Psychosis that occurs in Arctic explorers and mountaineers who are exposed to a lack of diverse stimuli in the snow-clad environment.

WHO World Health Organization.

Williams syndrome A genetic disorder associated with a microdeletion on chromosome 7 and is characterized by “elfin-like” facial features, mild or moderate intellectual disability, cardiovascular disease, hyperacusis, hypercalcemia, and neuromusculoskeletal and renal abnormalities.

Wilson disease An autosomal recessive genetic disorder that causes excessive amounts of copper in the liver or brain. Patient may show psychological symptoms such as depression, suicidal ideation, and aggression. Is fatal without treatment.

windigo Culture-specific syndrome seen in Canadian Indians, characterized by a delusion of transformation into or possession by a windigo (wihtigo), a feared supernatural cannibalistic monster.

WISC Wechsler Intelligence Scale for Children.

withdrawal 1. Pathologic retreat from interpersonal contact and social involvement; extreme decrease of intellectual and emotional interest in the environment. It may be seen in schizophrenia and depression. **2.** *See* substance withdrawal.

withdrawal syndrome Stereotyped constellation of signs and symptoms that appears when a person stops taking a drug or chemical substance on which they have become physically dependent. It is more likely to appear immediately after abrupt discontinuation, but may also appear a few days later; specific clinical features are characteristic for the particular drug or substance. Also called abstinence syndrome; discontinuation syndrome.

Telegram: @medical_k

www.konkur.in

word approximation Use of conventional words in an unconventional or inappropriate way (metonymy) or of new words that are developed by conventional rules of word formation (e.g., “handshoes” for gloves and “time measure” for clock); distinguished from a neologism, which is a new word whose derivation cannot be understood. *See also* paraphasia.

word association technique Technique devised by Carl Jung, who presented stimulus words to patients and had them respond with the first word that came to mind; it gives insight into persons’ unconscious or subconscious thinking.

word blindness Obsolete word for alexia.

word salad Incoherent, essentially incomprehensible mixture of words and phrases commonly seen in far-advanced cases of schizophrenia. *See also* incoherence.

working through In psychoanalysis, the repeated and varied examination of a conflict, neurotic trend, or other problem for the purpose of increasing insight into unconscious processes and effecting adaptive personality changes; constitutes a fundamental facet of the psychoanalytic process.

World Health Organization (WHO) Specialized agency of the United Nations, established in 1948, governed by the World Health Assembly. Technical committees and regional organizations further the purpose of the WHO: “the attainment by all people of the highest level of health.” It publishes the *International Classification of Diseases* (ICD).

World Psychiatric Association (WPA) International association, encompassing psychiatric associations from 75 countries throughout the world, whose objectives are to strengthen and promote international cooperation in psychiatry and among psychiatrists working in different fields and to encourage the exchange of information concerning psychiatric disorders.

WPA World Psychiatric Association.

WPPSI Wechsler Preschool and Primary Scale of Intelligence.

X-Y-Z

Telegram: @medical_k

xenophobia Abnormal fear of strangers.

yohimbine Drug that blocks adrenergic α-receptors; because of its parasympathetic effect that causes vasodilatation, it has been used as an agent to help induce penile erection.

York retreat One of the earliest hospitals for the mentally ill, founded in 1792 in York, England, by William Tuke and other Quakers.

yttrium-90 Radioisotope that has been implanted experimentally in the brain to destroy certain tracts and areas in an effort to improve severe mental disorder.

zeitgeist German word for the general intellectual, moral, and cultural climate of an era.

zoophilia Paraphilia in which animals are used to produce sexual excitement. *See also* bestiality.

zoophobia Abnormal fear of animals.

z-score STANDARDIZED SCORE.

Zung Self-Rating Depression Scale (SDS) Twenty-item report in which the patient answers questions about symptoms of depressive disorders such as sleep patterns, appetite disturbance, libido, irritability, and hopelessness.

zygote Fertilized egg produced by the union of two cells (sperm and ovum) to form a diploid cell in sexual reproduction.

zygotic Pertaining to a zygote or to the individual developing from such a fertilized egg.

Appendix C

Comparative Diagnoses

The following tables summarize the key features of the most common psychiatric diagnoses.

The columns compare the diagnoses of the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision (DSM-5-TR) (2022), International Statistical Classification of Diseases and Related Health Problems 10th Revision (ICD-10), 2019 version which is still in use in the United States, and the International Statistical Classification of Diseases and Related Health Problems 11th Revision (ICD-11) (2022).

The rows list the domains common to most diagnostic systems: Diagnostic name, Duration (if required), Symptoms, Required number of symptoms, Psychosocial consequences (of the disorder), Exclusions (the symptoms are not better explained by____), Symptom specifiers, Course specifiers, Severity specifiers, and additional comments. In cases where no system commons on that domain, the row is omitted.

The tables are meant to compare diagnostic approaches and are not intended as a substitute for the actual criteria. The reader is referred to the source materials for the criteria.

Not all diagnoses are included here. For example, the three classification system includes secondary disorders (“due to a medical condition,” “due to a substance”), which should be used if the evaluation determines that the symptoms are better explained by a medical condition or the effects of a medication or substance. They also include “Other” and “Unspecified” categories to include cases of clinically significant symptoms that do not meet the full criteria, or there is insufficient information, or the clinician chooses not to specify why the criteria are not met. In both cases, those diagnoses are omitted here.

Childhood Onset Fluency Disorder (Stuttering)

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Childhood onset fluency disorder (Stuttering)	Stuttering (stammering)	Developmental speech fluency disorder
Duration	Onset of symptoms during the developmental period		Onset of symptoms during the developmental period
Symptoms	Fluency and speech abnormalities as evidenced by: ▶ Repetition of sounds and/or syllables ▶ Prolonging sounds or consonants ▶ Using broken words ▶ Blocking or pausing ▶ Frequent word substitution (circumlocution) ▶ Excess physical tension during word production ▶ Repeating monosyllabic words	Speech is characterized by repetition or prolongation of sounds or words or by frequent pauses, resulting in disruption or normal flow or rhythm of speech.	Frequent or pervasive disruption of the normal rhythmic flow and rate of speech, including: ▶ repetitions and prolongations in sounds, syllables, words, and phrases ▶ as well as blocking (inaudible or silent fixations or inability to initiate sounds) ▶ word avoidance or substitutions
Psychosocial consequences	Causing severe anxiety and/or impairment in areas of functioning		Limitations in communication affect social, academic, and occupational functioning
Exclusions	Result of: ▶ Speech-motor or sensory issues ▶ Neurologic injury ▶ Another medical condition ▶ Another mental disorder Note: later-onset cases after the developmental period are coded as "adult-onset fluency disorder"	Result of: Tic disorders	Disorder of Intellectual Development Disease of the Nervous System Sensory impairment Structural abnormality

Table 8.
Autism Spectrum Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Autism spectrum disorder	Childhood autism	Autism spectrum disorder
Symptoms	Symptoms of difficulties/deficits in social interaction, as evidenced by: ▶ Deficits in emotional reciprocity or failure to respond appropriately in social interactions ▶ Deficits in nonverbal communication, eye contact, body language/gesturing, and/or facial expression ▶ Deficits in forming, developing, or maintaining relationships or friendships Restricted and/or repetitive behaviors or interests, such as in: ▶ Stereotyped motor movements ▶ Inflexibility with regard to daily routines or rituals ▶ Restricted or fixed interests ▶ Hyper- or hyporeactivity to sensations or sensory stimuli Symptoms present in the early developmental period	Pervasive disorder of development involving ▶ Abnormal development present before the age of 3 ▶ Abnormal social functioning, communication, and repetitive/restricted behaviors	Persistent deficits in initiating and sustaining social communication and interactions outside the range for that age. May include limitations in: ▶ Understanding or responding to verbal or nonverbal communication ▶ Understanding or using language in a social context ▶ Social awareness ▶ Ability to imagine or respond to feelings ▶ Mutual sharing of interests ▶ Ability to make and sustain peer relationship Persistent restricted, repetitive, and inflexible patterns of behavior, interests, or activities that are inappropriate or excessive for the social context. These may include persistent: ▶ Lack of adaptability to new experiences or circumstances ▶ Inflexible adherence to routines ▶ Excess adherence to rules ▶ Excess and persistent ritualized patterns of behavior ▶ Repetitive and stereotyped motor movement

Telegram: @medical_k

www.konkur.in

			▶ Preoccupation with ≥1 special interests, parts of objects, or stimuli ▶ Hyper or hyposensitivity to sensory stimuli or unusual interest in the stimuli
Required number of symptoms	All three of the above criteria met		
Psychosocial consequences	Marked impairment in functioning		Marked impairment in functioning
Exclusions	Result of: ▶ Intellectual disability ▶ Global developmental delay		Rett syndrome
Symptom specifiers	***With or without accompanying intellectual impairment*** ***With or without accompanying language impairment*** ***Associated with another neurodevelopmental, mental, or behavioral disorder*** ***With catatonia***		With or without accompanying intellectual impairment With or without accompanying language impairment ▶ With mild or no impairment of functional language ▶ With impaired functional language ▶ With complete, or almost complete, absence of functional language
Severity specifiers	For social impairment: **mild, moderate, severe** For behavior patterns: **mild, moderate, severe**		
		NOTE: atypical autism–symptoms do not meet all diagnostic criteria for childhood autism NOTE: Asperger syndrome—difficulties in social interaction similar to that found in autism, in addition to restricted interests;

www.konkur.in

Table 9.
Attention-Deficit/Hyperactivity Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Attention-deficit/hyperactivity disorder	Hyperkinetic disorders Disturbance of activity and attention	Attention-deficit hyperactivity disorder
Duration	6 months or longer		Persistent for ≥6 months, begins before age 12 (usually)
Symptoms	A persistent pattern of either or both of inattention, as evidenced by: ▶ Failure to give attention to details or making frequent mistakes ▶ Difficulty maintaining attention or focus ▶ Not seeming to listen when spoken to ▶ Failing to follow through with tasks or instructions ▶ Difficulty organizing tasks ▶ Avoiding or delaying tasks that require sustained mental effort or attention ▶ Frequently losing or misplacing items ▶ Easily distracted ▶ Forgetfulness Hyperactivity/impulsivity, as evidenced by: ▶ Fidgeting or restlessness ▶ Inability to remain in a seat ▶ Running around or climbing in inappropriate social situations ▶ Inability to engage in quiet play or activities ▶ Difficulty remaining still or inactive ▶ Talking excessively ▶ Blurting out answers without waiting for their turn	Early onset (usually before the age of 5) of inability to engage in activities requiring prolonged attention, in addition to disorganization of task completion and excessive activity. There may also be associated impulsivity, recklessness, and social disinhibition.	▶ Inattention symptoms and/or a combination of hyperactivity and impulsivity symptoms ▶ Outside the limits of normal variation expected for age and level of intellectual development ▶ Symptoms vary according to chronologic age and disorder severity ▶ Occur in a variety of settings Inattention ▶ Difficulty sustaining attention ▶ Easily distracted ▶ Loses things Hyperactivity ▶ Excess motor activity ▶ Difficulty engaging in activities quietly ▶ Blurts out answers in school ▶ Inappropriately acts out in response to stimuli

Telegram: @medical_k

www.konkur.in

	▶ Difficulty waiting for one's turn ▶ Frequently interrupting others Symptoms present before the age of 12, with symptoms present in ≥2 settings		
Required number of symptoms	≥6 symptoms of inattention (≥5 for adolescents/adults) and/or ≥6 of hyperactivity-impulsivity (≥5 for adolescents/adults)		
Psychosocial consequences	Impairment in functioning		Impairment in functioning
Exclusions	Result of: ▶ Other mental illness		Another mental disorder Substance or medication
Symptom specifiers	***Combined presentation*** ***Predominantly inattentive presentation*** ***Predominantly hyperactive/impulsive presentation***		Combined presentation Predominantly inattentive presentation Predominantly hyperactive/impulsive presentation
Course specifiers	***In partial remission*** *(full/all criteria not met for prior 6 months, though symptoms still causing significant impairment)*		
Severity specifiers	**Mild** (few symptoms in excess of the minimum required for diagnosis, in addition to only minor impairment at most in functioning) **Moderate** (intermediate severity/impairment) **Severe** (several symptoms of high severity and resulting in marked impairment)

Table 10.
Specific Learning Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Specific learning disorder	Specific developmental disorders of scholastic skills Specific reading disorder Specific spelling disorder Specific disorder of arithmetical skills Mixed disorder of scholastic skills	Developmental learning disorder
Duration	≥6 months		Onset in early school years
Symptoms	Difficulties with learning or academics, below what would be expected per individual's age or school level, as evidenced by: ▶ Inaccuracy or slowness with reading ▶ Difficulty understanding or comprehending what is being read ▶ Trouble with spelling ▶ Difficulty with written expression ▶ Difficulties with numbers or calculation ▶ Difficulties with mathematical reasoning Symptoms begin during school-age years (but may become obvious during the later part of academic career)		The presence of significant limitations in learning academic skills of reading, writing, or arithmetic, resulting in a skill level markedly below what would be expected for age
Required number of symptoms			
Psychosocial consequences	Impairment in functioning		Significant impairment to academic, occupational, or other areas of functioning
Exclusions	Result of:		External factors

Telegram: @medical_k

www.konkur.in

	▶ Intellectual disability ▶ Visual or auditory impairment ▶ Another mental disorder ▶ Another medical disorder ▶ Psychosocial adversity ▶ Result of inadequate educational instruction	(economic, environmental disadvantage, lack of access to educational opportunities) Disorders of intellectual development, other neurodevelopmental disorders, and motor or sensory disorders
Symptom specifiers	***With impairment in reading*** ***With impairment in written expression*** ***With impairment in mathematics***	Impairment in reading Impairment in written expression Impairment in mathematics
Course specifiers		
Severity specifiers	**Mild** (minimal accommodations or support needed during school) **Moderate** (some accommodations needed) **Severe** (intensive individualized and specialized teaching needed for most of the schooling)	
Comments		Other specified impairments in learning Developmental learning disorder, unspecified

Motor Disorders

Telegram: @medical_k

www.konkur.in

Table 11.
Developmental Coordination Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Developmental coordination disorder	Specific developmental disorder of motor function	Developmental motor coordination disorder
Duration	Onset in the early developmental period		Onset in the early developmental period
Symptoms	The development of coordinated motor skills is far behind what would be expected for an individual's chronologic age	Significant impairment in motor coordination	Significant delay in the acquisition of gross or fine motor skills and impairment in the execution of coordinated motor skills. May manifest as ▶ Clumsiness ▶ Slowness ▶ Inaccuracy of motor performance. Coordinated motor skills are markedly below that expected on the basis of age.
Required number of symptoms			
Psychosocial consequences	Resulting in impaired ability to play, perform self-care, and function.		Limitations in activities of daily living, school work, vocation, leisure activities, or other important areas of functioning
Exclusions		General intellectual retardation Any specific congenital or neurologic disorder	Disease of the nervous system Disease of the musculoskeletal system Connective tissue disease Sensory impairment Disorder of intellectual development
Symptom specifiers	Result of: *Another neurologic condition* *Intellectual disability* *Visual impairment*

www.konkur.in

Table 13.
Tourette Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Tourette disorder	Combined vocal and multiple motor tic disorder (de la Tourette)	Tourette syndrome
Duration	Despite waxing or waning, symptoms have been present for ≥1 year since the initial onset		≥1 year. Onset in developmental period.
Symptoms	Presence of both motor and vocal tics over the course of illness, with onset <age 18	Tic disorder involving multiple motor ticks and ≥1 more vocal tics; symptoms present in childhood or adolescence and tend to persist into adulthood.	The presence of both motor tic(s) and phonic tic(s) that may or may not manifest concurrently or continuously during the symptomatic course. Motor and phonic tics are defined as sudden, rapid, nonrhythmic, and recurrent movements or vocalizations, respectively.
Exclusions	Other medical condition Substance- or medication-induced, including withdrawal		Another medical condition (e.g., Huntington disease) Substance or medication on (e.g., amphetamine), including withdrawal effects (e.g., from benzodiazepines).
Comments	If symptoms of ONLY motor OR vocal tics, the diagnosis would be “Persistent (Chronic) Motor or Vocal Tic Disorder”

Table 15.
Delusional Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Delusional disorder	Delusional disorder	
Duration	≥1 month	Does not specify	Typically ≥3 months
Symptoms	Defined by the presence of ≥1 delusions, characterized per specifiers listed below	Presence of single or multiple delusions that are persistent and may or may not be associated with hallucinations	▶ The presence of a delusion or set of related delusions ▶ Delusions vary in content but are stable within individuals, although they can evolve over time ▶ No hallucinations, disorganized thinking, or other evidence of a thought disorder ▶ Affect, speech, and behavior are typically unaffected
Psychosocial consequences	No marked impairment in psychosocial functioning, behavior, or obvious bizarre		
Exclusions	Having a history of meeting the criteria for schizophrenia Other medical condition Substance or medication including withdrawal Other mental illness	Personality disorder Psychosis, psychogenic reaction Schizophrenia	Other medical condition Substance or medication, including withdrawal Other mental illness
Symptom specifiers	**Erotomanic type**: delusion centered on the belief that another person is in love with the affected individual **Grandiose type**: delusions of grandeur prominent **Jealous type:** delusion centered on the belief that a partner is being unfaithful **Persecutory type:** delusions centered on the belief that one is being targeted		Positive symptoms Negative symptoms Depressive mood symptoms Manic mood symptoms Psychomotor symptoms Cognitive symptoms

Telegram: @medical_k

www.konkur.in

	Somatic type: delusions focus on body and/or physical symptoms **Mixed type:** no predominant theme of delusions **Unspecified type** **With bizarre content:** if the content of delusions is felt to be wholly unrelated to reality or life experiences and/or completely impossible	
Course specifiers	**First episode, currently in acute episode** **First episode, currently in partial remission** (with partial remission refined as improvement in symptoms such that diagnostic criteria may no longer be fully met) **First episode, currently in full** remission (with full remission defined as lack of any symptoms) **Multiple episodes, currently in acute episode** **Multiple episodes, currently in partial remission** **Multiple episodes, currently in full remission** **Continuous** **Unspecified**	Currently symptomatic In partial remission In full remission

Table 21.
Bipolar 2 Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Bipolar 2 disorder	Bipolar affective disorder ***NOTE**:* ICD-10 does not distinguish between Bipolar 1 and 2, requiring only a history of discrete episodes of mania, hypomania, and/or depression, with episodes demarcated by switches in mood/affect.	Bipolar type II disorder
Duration	**Hypomanic episode:** lasting ≥4 days, with symptoms, present most of the day for most days **Major depressive episode**: symptoms lasting ≥2 weeks	Manic episode: lasting ≥1 week Hypomanic episode: lasting ≥4 days Major depressive episode: symptoms lasting ≥2 weeks	Several days
Symptoms	Hypomanic episodes involve abnormally elevated or irritable mood with: ▶ Grandiosity ▶ Decreased need for sleep ▶ Pressured speech ▶ Racing thoughts with expansiveness of thought ▶ Distractibility ▶ Goal-directed or non–goal-directed hyperactivity ▶ Engagement in high-risk activity or increased impulsivity Depressive episode involving depressed mood and/or decreased interest/pleasure with: ▶ Unintentional weight loss or change in appetite ▶ Disruption of sleep ▶ Psychomotor changes ▶ Loss of energy	History of discrete episodes of mania, hypomania, and/or depression, with episodes demarcated by switches in mood/affect. Episodes are defined as follows: **Mania:** abnormally elevated or irritable mood with ≥3 of the following (≥4 if mood irritable) ▶ Increased activity ▶ Increased talkativeness ▶ Flight of ideas/racing thoughts ▶ Social disinhibition ▶ Decreased need for sleep ▶ Grandiosity ▶ Distractibility ▶ Increased recklessness and impulsivity ▶ Hypersexuality **Hypomania:** abnormally elevated mood with ≥3	**Hypomanic Episode** Elevation of mood or irritability outside of the usual mood range Increased activity Talkativeness Flight of ideas Increased self-esteem Decreased need for sleep Distractibility Impulsivity Increased libido, sociability, or goal-directed activity Depressive episode *See depressive disorders*

Telegram: @medical_k

www.konkur.in

	▶ Difficulty with concentration and/or attention ▶ Excessive feelings of worthlessness and/or guilt ▶ Recurrent thoughts of death, including passive and/or active suicidal ideation	of the following: ▶ Psychomotor agitation ▶ Increased talkativeness ▶ Poor concentration or increased distractibility ▶ Decreased need for sleep ▶ Hypersexuality ▶ Impulsivity or increased spending ▶ Over-familiarity Depressive episode: 4 total symptoms from among the following: ≥2: ▶ Depressed mood ▶ Loss of interest or pleasure ▶ Decreased energy Additional symptoms: ▶ Low self-esteem ▶ Excessive guilt or shame ▶ Recurrent thoughts of death or suicide ▶ Poor concentration ▶ Psychomotor changes ▶ Sleep disturbance ▶ Change in appetite and/or weight	
Required number of symptoms	Lifetime history of a hypomanic episode involving elevated/irritable mood with ≥3 of the above symptoms (4 if mood irritable) Lifetime history of a depressive episode with ≥5 of the above symptoms, which must include ≥1 depressed mood or loss of pleasure	**Bipolar affective disorder, current episode hypomanic**—meets the above criteria for hypomania (elevated mood with ≥3 listed symptoms) and has a history of prior affective episodes (manic, hypomanic, depressed, mixed) **Bipolar affective disorder, current episode manic**—meets above criteria for mania (elevated or irritable mood with ≥3–4 listed symptoms) and	≥1 hypomanic episode ≥1 depressive episode

Telegram: @medical_k

www.konkur.in

		has a history of prior affective episodes (manic, hypomanic, depressed, mixed) **Bipolar disorder, current episode mixed**—mixture or rapid alteration in hypomanic, manic, and/or depressive symptoms, with symptoms, present most of the time for ≥2 weeks, in addition to having a history of prior affective episodes (manic, hypomanic, depressed, mixed) **Bipolar disorder, current episode mild/moderate/severe depression**—current symptoms meet criteria for a depressive episode, in addition to having a history of prior affective episodes (manic, hypomanic, depressed, mixed)	
Exclusions	Other medical condition Substance or medication, including withdrawal Other mental illness	Psychoactive substance use Another mental disorder	H/o manic episodes Other medical condition Effect of substance or medication
Psychosocial consequences	Hypomanic episode: NO marked impairment in functioning and NO hospitalization necessitated Depressive episode: marked distress and/or impairment in psychosocial functioning		Does not cause marked functional impairment
Symptom specifiers	**Current episode:** *Depressed* *Hypomanic* Additional specifiers to be added to the above:	**Current episode hypomanic** Current episode manic without psychotic symptoms	**Current/most recent episode** Hypomanic Depressive With/without psychotic symptoms

With anxious distress: including ≥2 symptoms among feeling tense, restlessness, difficulty with concentration due to worrying, excessive fear without an identifiable cause, fear of loss of control

With mixed features—full criteria met for either depressive or manic/hypomanic episode, with additional symptoms of depressive or manic/hypomanic period without also meeting full criteria

With rapid cycling—the presence of ≥4 mood episodes over the course of a 12-month period, with ≥2-month period of partial/full remission between mood episodes

With melancholic features—involving loss of pleasure, reduced reactivity with ≥3 of the following:

- Depressed mood/despair
- Depressive symptoms worse in the morning
- Early morning awakening
- Psychomotor changes
- Loss of appetite/weight loss
- Excessive guilt

With atypical features: during most days, an individual is experiencing mood reactivity with ≥2 symptoms of:

- Weight gain or increased appetite

Current episode manic with psychotic symptoms

- ***With mood congruent psychotic symptoms***
- ***With mood incongruent psychotic symptoms***

Current episode moderate or mild depression—≥4 (mild) or 6 (moderate) symptoms present, including ≥2 among loss of pleasure, depressed mood, and low energy

With somatic syndrome—≥4 of the following:

- *Loss of interest or pleasure*
- *Lack of emotional reactivity*
- *Early morning awakening*
- *Depression gets worse in the mornings*
- *Psychomotor changes*
- *Loss of appetite*
- *Weight loss*
- *Loss of sexual drive*

Without somatic syndrome

Current episode severe depression without psychotic symptoms—≥8 symptoms present, including all 3 of loss of pleasure, depressed mood, and low energy

Current episode severe depression with psychotic symptoms—≥8 symptoms present, including all 3 of loss of pleasure, depressed mood, and

Persistent Depressive Disorder/Dythymia/Dysthymic Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Persistent depressive disorder	Dysthymia	Dysthymic disorder
Duration	Symptoms continuously present for ≥2 years No time during the affected period of no symptoms for >2 months		≥2 years
Symptoms	Depressed mood most of the time on a majority of days over a period of ≥2 years (NOTE: in children, irritability may be present, and duration must be for a period of ≥1 year) During the depressed period: ▶ Abnormal appetite (↑ or ↓) ▶ Abnormal sleep (↑ or ↓) ▶ ↓ energy ▶ ↓ self-esteem ▶ ↓ concentration or ↑ indecisiveness ▶ Hopelessness	Chronically depressed mood that does not meet criteria for a depressive episode, though criteria may have been met in the past.	Persistent depressed mood Additional symptoms of depression. May include: ▶ Anhedonia or decreased interest ▶ Poor concentration ▶ Low self-worth or inappropriate guilt ▶ Hopelessness ▶ Disturbed sleep ▶ Change in appetite ▶ Fatigue or low energy
Required number of symptoms	≥2 bulleted symptoms		
Psychosocial consequences	Marked distress and/or functional impairment		Marked distress and/or functional impairment
Exclusions	This cannot occur with a history of bipolar disorder Other medical condition Substance or medication, including withdrawal Other mental illness	Result of: ▶ Anxiety ▶ Depression ▶ Bereavement ▶ Schizophrenia	A depressive episode in the first 2 years of the disorder History of manic, mixed, or hypomanic episodes Other medical condition Substance or medication, including withdrawal
Symptom specifiers	**With pure dysthymic syndrome:** criteria for the depressive episode not met in the last 2 years		

Telegram: @medical_k

www.konkur.in

With persistent major depressive episode: has met diagnostic criteria for a depressive episode for an entire 2-year period

With intermittent major depressive episode, with current episode: though may currently meet criteria for major depressive disorder, has had a period of ≥8 weeks during the prior 2-year period during which symptoms were below the diagnostic threshold for a depressive episode.

With intermittent major depressive episode, without current episode: does not currently meet criteria for a depressive episode, though has experienced ≥1 depressive episode over the course of the prior 2 years.

With anxious distress: including ≥2 symptoms among feeling tense, restlessness, difficulty with concentration due to worrying, excessive fear without an identifiable cause, fear of loss of control.

With mixed features—full criteria met for either depressive or manic/hypomanic episode, with additional symptoms of depressive or manic/hypomanic period without also meeting full criteria.

Table 39.
Reactive Attachment Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Reactive attachment disorder	Reactive attachment disorder of childhood	Reactive attachment disorder
Symptoms	Behavioral pattern characterized by emotional withdrawal ▶ Not seeking or not responding to emotional comforting A pattern of social/emotional disturbance ▶ Lack of mood reactivity or positive affective response to stimuli ▶ Inappropriate mood lability/irritability/sadness History of exposure to severely insufficient care-giving ▶ Severe neglect ▶ Unstable caregiving environment with frequent changes in caregivers ▶ Being raised in unusual care settings Evidence for the disorder after the developmental age of 9 and before age 5	A pattern of abnormal social relationships involving emotional disturbance and behavioral changes ▶ i.e., fear, hypervigilance, poor socialization, aggression toward self and others, delayed growth in some instances Symptoms present before 5 years of age Likely occur as a direct result of neglect, abuse, or maltreatment during rearing	History of grossly insufficient care ▶ Disregard for the child's physical and emotional needs ▶ Frequent changes in primary caregivers ▶ Rearing in unusual settings ▶ Maltreatment Abnormal attachment behaviors ▶ Minimal seeking of comfort when distressed ▶ Minimal response to comfort when offered Insufficient care is presumed to be responsible for the child's behaviors Evidence for the disorder after the developmental age of 9 and before age 5
Required number of symptoms	All of the above categories, with behavioral symptoms, felt to be the direct result of exposure to inadequate caregiving or rearing environment		
Psychosocial consequences	Significant disturbance of behavior		
Exclusions	Autism spectrum disorder	Asperger syndrome Disinhibited attachment disorder of childhood Maltreatment syndromes Normal variation in the pattern of selective attachment Sexual or physical abuse in childhood,	Autism spectrum disorder Not confined to one relationship

Table 41.
Post-Traumatic Stress Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Post-traumatic stress disorder	Post-traumatic stress disorder	Post-traumatic stress disorder
Duration	>1 month	Symptoms arise in weeks to months following the traumatic event	
Symptoms	History of exposure to (directly experiencing, repeated exposure witnessing in person, learning of occurrence in close acquaintance) actual threatened death, severe injury, or sexual trauma Intrusive symptoms ▶ Involuntary intrusive memories ▶ In children <6 years may see a re-enactment of the event through play ▶ Recurrent nightmares/dreams of the event ▶ In children <6 years, frightening dreams without identifiable content may be present ▶ Dissociative responses or reliving of prior experience (i.e., flashbacks) ▶ In children <6 years may see a re-enactment of the event through play ▶ Psychological distress related to exposure to stimuli that are reminders of prior trauma	Symptoms arise as a delayed or prolonged response to a single or recurrent stressful experience that is life-threatening or catastrophic in severity The traumatic event would cause distress in most individuals Symptoms may include ▶ Flashbacks ▶ Dreams/nightmares ▶ Emotional blunting and subjective numbness ▶ Social withdrawal/detachment ▶ Anhedonia ▶ Avoidance ▶ Hyperarousal/hypervigilance ▶ Sleep disturbance May or may not be associated with co-occurring anxiety and/or depression	Exposure to an extremely threatening or horrifying event. Following the event develops symptoms in all three of the following categories: ▶ Re-experiencing the trauma ▶ Avoiding reminders of the trauma ▶ Persistent perception of heightened threat (e.g., hypervigilance)

Telegram: @medical_k

www.konkur.in

	▶ Presence of physiologic response to stimuli that are reminders of prior trauma Avoidance of stimuli associated with prior experience of trauma ▶ Avoidance of memories related to trauma ▶ Avoidance of external reminders of the trauma Negative mood or cognitions related to trauma ▶ Impairment in memories related to the event ▶ Negative perceptions of self and others ▶ Cognitive distortions related to the event ▶ Excessive guilt, anger, or fear ▶ Diminished interest and social withdrawal ▶ Subjective detachment from others ▶ Difficulty experiencing positive feelings in response to previously pleasurable stimuli Altered level of arousal ▶ Irritability and/or anger ▶ Risk-taking ▶ Hypervigilance ▶ Increased startle response ▶ Difficulties with concentration ▶ Sleep disturbances	
Required number of symptoms	In addition to a history of exposure to	Any of the above

Telegram: @medical_k

www.konkur.in

	trauma, they must have ▶ ≥1 symptom of intrusion ▶ ≥1 symptom of avoidance ▶ ≥2 symptoms of negative mood/cognition ▶ ≥2 symptoms of arousal alterations,	
Psychosocial consequences	Marked distress and impairment in functioning	Impairment in functioning
Exclusions	Exposure through media, electronics, movies, or photo Related to substance use Related to another medical condition	Acute stress reaction Complex post-traumatic stress disorder
Symptom specifiers	**With dissociative symptoms:** ▶ **Depersonalization:** perception of feeling outside one's own body ▶ **Derealization:** perception of the surrounding environment being unreal or distorted	
Course specifiers	**With delayed expression** ▶ All diagnostic criteria are not met until ≥6 months after an initial traumatic event

Table 43.
Adjustment Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Adjustment disorder	Adjustment disorders	Adjustment disorder
Duration	Occurring within 3 months of an acute stressor and resolving within 6 months of the resolution of the stressor		Within 6 months of the resolution of the stressor
Symptoms	Emotional or behavioral changes Marked distress/impairment that is felt to be out of proportion to the stressor itself	Subjective distress/emotional disturbance Arises during the period of adaptation to a change or stress Symptoms of depressed mood or anxiety may arise, and conduct disturbance may be noted in adolescents	A maladaptive reaction to an identifiable psychosocial stressor, consisting of preoccupation with the stressor or its consequences
Required number of symptoms	All of the above		
Psychosocial consequences	Marked distress/functional impairment	Often result in impairment in social functioning	Functional impairment
Exclusions	Exacerbation of existing mental illness Normal bereavement Other psychiatric illness		Separation anxiety disorder of childhood Recurrent depressive disorder Single-episode depressive disorder Prolonged grief disorder Uncomplicated bereavement Burnout Acute stress reaction
Symptom specifiers	**With depressed mood:** ▸ Predominant low mood, hopelessness **With anxiety:** ▸ Predominant anxiety, worry **With mixed anxiety and depressed mood:** ▸ Both low mood and anxiety present **With mixed disturbance of emotions and**

Table 44.
Prolonged Grief Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Prolonged grief disorder	Adjustment disorder, grief reaction (see Adjustment disorder)	Prolonged grief disorder
Duration	Within 12 months (6 for child or adolescents) after a death of a person close to the individual. Symptoms last ≥1 month.		An atypically long time following a loss and ≥6 months
Symptoms	Persistent grief ▶ Longing for the deceased ▶ Preoccupation with thoughts of the deceased Accompanying symptoms relating to or resulting from the death: ▶ Identity disruption ▶ Disbelief about the death ▶ Avoiding reminders of the loss ▶ Intense emotional pain ▶ Difficulty resuming relationships/activities ▶ Emotional numbness ▶ Feeling life is meaningless ▶ Intense loneliness		Bereavement following the death of a close person Persistent/pervasive grief response
Required number of symptoms	Persistent grief: one or both Accompanying symptoms: ≥3		
Psychosocial consequences	Marked distress/functional impairment		Marked distress/functional impairment
Exclusions	Normal grief Other medical disorder Other mental disorder Substance use		

8. DISSOCIATIVE DISORDERS

Telegram: @medical_k

www.konkur.in

Table 45.
Dissociative Identity Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Dissociative identity disorder	Dissociative (conversion) disorder, unspecified	Dissociative identity disorder
Symptoms	Disrupted sense of identity, which is related to the presence of ≥2 personality states, with associated changes in the sense of self-control, affect, behavior, memory, perception, or sensory-motor function Gaps in memory related to past events or personal information	Disruption of identity characterized by the presence of ≥2 distinct personality states ≥2 personalities recurrently take executive control of the individual's consciousness and functioning Changes in personality state are accompanied by alterations in sensation, perception, affect, cognition, memory, motor control, and behavior.	
Required number of symptoms	All of the above Symptoms part of an accepted belief system		
Exclusions	Normal forgetting Other medical condition Substance or medication, including withdrawal Fantasy play in children	Other mental disorder Substance or medication Other medical disorder	
Psychosocial consequences	Marked distress and/or impairment	Functional impairment	
Comments	Trance and possession disorders: temporary loss of the sense of personal identity and full awareness of the surroundings that are outside of culture-bound norms.

Table 47.
Depersonalization/Derealization Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Depersonalization/derealization disorder	Other dissociative (conversion) disorders	Depersonalization/derealization disorder
Symptoms	Depersonalization (sense of being detached from self or being an outside observer of one's own experiences, sense of unreality, and distorted time/perception) Derealization (sense of unreality or detachment from one's surroundings) During depersonalization or derealization, reality testing remains intact	Includes: Ganser syndrome (intentionally acting like one has a physical or mental illness despite not being sick) Multiple personalities	Persistent experience of either or both: ▶ Depersonalization: experiencing oneself as strange or unreal ▶ Derealization: experiencing other persons/places/objects as strange or unreal During depersonalization or derealization, reality testing remains intact
Required number of symptoms	One or both depersonalization and/or realization, in addition to intact reality testing during episodes		
Exclusions	Other medical condition Substance or medication, including withdrawal Other mental illness		Other medical condition Substance or medication, including withdrawal Other mental illness
Psychosocial consequences	Marked distress and/or impairment		Marked distress and/or impairment

9. SOMATIC SYMPTOMS AND RELATED DISORDERS

Telegram: @medical_k

www.konkur.in

Table 48.
Somatic Symptom Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Somatic symptom disorder	Somatization disorder	Bodily distress disorder
Duration	Symptoms persistent for a period of usually ≥6 months	≥2 years	Persistent, last ≥ several months
Symptoms	Persistent and recurrent thoughts related to the potential severity and seriousness of one's symptoms Out-of-proportion anxiety about these symptoms and overall health Spending excessive amounts of time and energy on these symptoms	Multiple recurring and frequently changing physical symptoms, often accompanied by a long history of involvement in the medical system, frequent use of health care services, and workups not revealing the clear cause of symptoms.	≥1 distressing bodily symptoms Excessive attention to symptoms (preoccupation with symptoms, repeated health care contacts) Attention persists despite reassurance from a healthcare provider
Required number of symptoms	≥1 of the above		
Exclusions		Malingering	Other mental illness
Psychosocial consequences	Marked distress and/or impairment	Disruption of social, interpersonal, and family behavior.	Functional impairment
Symptom specifiers	***With predominant pain***		
Course specifiers	**Persistent:** severe symptoms and impairment for ≥6 months		
Severity specifiers	**Mild:** only 1 of the above symptom criteria is met **Moderate:** ≥2 of the above symptom criteria are met **Severe:** ≥2 of the above symptom criteria are met, in addition to having multiple somatic symptoms or 1 extremely severe somatic symptom	Undifferentiated somatoform disorder (<2 years of less severe symptoms) Somatoform autonomic dysfunction (particularly involving autonomic arousal symptoms, in addition to other less specific complaints Persistent somatoform pain disorder (pain symptoms are predominant among somatic complaints)	Mild Moderate Severe

Telegram: @medical_k

www.konkur.in

Table 49.
Illness Anxiety Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Illness anxiety disorder	Hypochondriacal disorder	Hypochondriasis
Duration	Symptoms persistent for a period ≥6 months		
Symptoms	Being excessively preoccupied with having or potentially acquiring a serious illness without somatic symptoms being present (or if present, only mild) Intense anxiety that is out of proportion to any potential risk (i.e., family history) that may exist for a given illness Performance of excessive health-related behaviors and/or presence of maladaptive behaviors or avoidance	Persistent preoccupation with potentially having ≥1 serious medical illness, with anxiety potentially manifesting as somatic complaints, anxiety regarding physical appearance, and potential depression/distress)	Persistent preoccupation or fear about the possibility of having ≥1 serious, progressive, or life-threatening illness, accompanied by Repetitive and excessive health-related behaviors (e.g., checking for illness) Avoidance behaviors related to health
Required number of symptoms	All of the above		
Exclusions	Other mental illness		Body dysmorphic disorder Bodily distress disorder Fear of cancer
Psychosocial consequences			Marked distress and/or impairment
Symptom specifiers	***Care-seeking type*** Care-avoidant type		
Comments		Note: body dysmorphic disorder is classified here.

Table 55.
Anorexia Nervosa

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Anorexia nervosa	Anorexia nervosa	Anorexia nervosa
Symptoms	Food restriction leading to abnormally low weight Fear of gaining weight and behaviors to prevent weight gain Distorted body image ▶ Misperceiving weight of shape ▶ Self-evaluation based on thinness, lack of recognition of the seriousness of one's weight	Deliberate weight loss induced by the patient Fear of being fat or flabby Associated physiologic disturbances due to low weight Specific behaviors: ▶ Restricted diet ▶ Excess exercise ▶ Binging behavior ▶ Use of appetite suppressants and diuretics	Low body weight Typically BMI <18.5 kg/m^2 in adults, and under 5th percentile in children and adolescents Pattern or restrictive eating or other behavior for maintaining a low weight Usually associated with fear of weight gain Excess preoccupation with body weight or shape
Required number of symptoms	All		
Exclusions		Loss of appetite (physical or psychological)	Other medical condition Food insecurity
Symptom specifiers	Restricting type: primary behaviors are dieting, fasting, and exercise for the last 3 months Binge eating type: binging and purging behavior for the last 3 months. It can include the use of laxatives or other substances to aid in purging.		
Course specifiers	Partial remission: symptoms present but no longer an abnormally low weight Full remission: no symptoms for a sustained period		
Severity specifiers	Severity is measured by BMI level Mild: BMI ≥17 kg/m^2 Moderate: BMI ≥16, <17 kg/m^2 Severe: BMI ≥15, <16 kg/m^2 Extreme: BMI <15 kg/m^2		
Comments		If lacking core symptoms, the diagnosis of "Atypical	

Telegram: @medical_k

www.konkur.in

anorexia nervosa" is made.

Table 56.
Bulimia Nervosa

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Bulimia nervosa	Bulimia nervosa	Bulimia nervosa
Duration	Occurs ≥1/wk for 3 months		Usually ≥1/wk for 1 month
Symptoms	Repeated binge-eating episodes ▶ Occurring within 2 hours period ▶ Loss of control during the episode Compensatory behaviors to prevent weight gain, such as ▶ Purging ▶ Laxatives ▶ Diuretics, other substances ▶ Excessive exercise ▶ Fasting Self-evaluation based on weight and shape	Binging Preoccupation with weight control Preoccupation with body shape and weight Associated physiologic disturbances due to repeated vomiting Specific compensatory behaviors: ▶ Vomiting ▶ Use of purgatives	Frequent episodes of binge eating Compensatory behaviors to prevent weight gain, most commonly purging Excess preoccupation with body weight or shape
Required number of symptoms	All	Not specified	
Psychosocial consequences			Distress or functional impairment
Exclusions	Does not occur only during episodes of anorexia nervosa		Anorexia nervosa
Course specifiers	Partial remission: full symptoms no longer met for a sustained time Full remission: no symptoms for a sustained period		
Severity specifiers	Severity is measured by the average number of compensatory behaviors in a week's time Mild: 1–3 Moderate: 4–7 Severe: 8–13 Extreme: 14+

www.konkur.in

Table 89.
Major and Mild Neurocognitive Disorders/Dementias

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Major and mild neurocognitive disorders	Dementias	Dementia
Symptoms	Significant (Major) or moderate (Minor) neurocognitive decline from baseline or impairment per neuropsychiatric testing in >1 cognitive domains of: ▶ Complex attention ▶ Executive function ▶ Learning and memory ▶ Language ▶ Perceptual-motor ▶ Social cognition		Marked impairment in ≥2 cognitive domains than expected for age and premorbid functioning
Required number of symptoms	See above criteria		
Exclusions	Delirium Other mental disorder		Coma Delirium Disorders of intellectual development Neurodevelopmental disorders Stupor Aging-associated decline in intrinsic capacity
Psychosocial consequences	Some impairments in the ability to independently perform activities of daily living		
Symptom specifiers	**Major/mild neurocognitive disorder due to Alzheimer disease** **Mild** **Probable:** evidence of causative genetic mutation **Possible:** no evidence of genetic mutation in addition to all of the following: ▶ A decline in memory and learning ▶ Progressive decline in cognition without extended plateaus ▶ No evidence of mixed etiology **Major** **Probable:** evidence of genetic mutation present or all three of the following: ▶ A decline in memory/learning in addition to ≥1 other cognitive domain ▶ Progressive decline without extended plateaus ▶ No evidence of a mixed etiology **Possible:** ▶ The above criteria are not met for probable	Dementia in Alzheimer disease Dementia in Alzheimer disease with early onset Dementia in Alzheimer disease with late onset Dementia in Alzheimer disease, atypical or mixed type Dementia in Alzheimer disease, unspecified Early onset: < age 65, and symptoms progressing more rapidly and involving multiple higher areas of cognitive functioning Late onset: after age 65, with slower progression and prominent memory deficits Symptoms present with insidious onset and progressive decline over several years and are accompanied by characteristic neuropathology and neurochemical features.	**Dementia due to Alzheimer disease** Insidious memory impairment Impairment in an additional cognitive domain May include mental or behavioral symptoms Course specifiers: Dementia due to Alzheimer disease Dementia due to Alzheimer disease with early onset Dementia due to Alzheimer disease with late onset Alzheimer disease dementia, mixed type, with cerebrovascular disease Alzheimer disease dementia, mixed type, with other nonvascular etiologies Dementia due to Alzheimer disease, onset unknown or unspecified Severity specifiers: Mild Moderate Severe

Telegram: @medical_k

www.konkur.in

Major/mild frontotemporal neurocognitive disorder			
Behavioral variant	**Language variant**	**Dementia in Picks disease** Circumscribed brain atrophy	**Frontotemporal lobar degeneration**
Spared learning and memory, with a decline in social cognition and/or executive function occurring with >1 of the following: ▶ Disinhibited behavior ▶ Apathy ▶ Loss of sympathy/empathy ▶ Perseveration or stereotypic behavior ▶ Hyperorality or dietary changes **Probable:** ▶ Evidence of possible genetic mutation ▶ Neuroimaging showing prominent frontal and/or temporal involvement **Possible:** above criteria not met	A decline in language prominent as evidenced by a decline in speech production, word finding, naming, grammar, and/or comprehension, with relative sparing in learning and memory **Probable:** ▶ Evidence of possible genetic mutation ▶ Neuroimaging showing prominent frontal and/or temporal involvement **Possible:** The above criteria are not met	**Progressive dementia, often beginning in middle age, involving changes in personality and social skills, with the eventual development of deficits in memory, mood, and neurologic function.**	Frontotemporal dementia Personality changes (apathy, inappropriate social behavior) Relatively preserved neurocognitive functioning during early stages Variants: Behavioral variant: personality changes, usually apathy and inappropriate social behavior, predominate and usually precede other cognitive changes. Primary progressive aphasia: affects language skills first Motoric variant: progressive motor impairment, with attention, executive functioning, and visuospatial functioning usually affected before memory. Severity specifiers: Mild Moderate Severe
Major or mild neurocognitive disorder with Lewy bodies		**Dementia in other specified diseases classified elsewhere**	**Lewy body disease**
Mild	**Major**		**Dementia due to Lewy body disease** Recurrent visual hallucinations Episodic confusion REM sleep behavioral disorder Parkinsonian symptoms Neurocognitive symptoms are progressive and usually affect visuospatial skills, attention, and executive functioning more than memory. Severity specifiers: Mild Moderate Severe
Core features: ▶ Fluctuation in cognition with significant variation in attention/alertness ▶ Recurrent well-formed visual hallucinations ▶ Parkinsonian symptoms presenting after cognitive decline Suggestive features: ▶ REM sleep behavior disorder ▶ Severe neuroleptic sensitivity **Probable:** the presence of two core features or one suggestive feature with >1 core feature **Possible:** one of the above three core features present			
Major or mild vascular neurocognitive disorder		**Vascular dementia**	**Dementia due to cerebrovascular disease**
Mild	**Major**		
In addition to history, imaging, or physical findings consistent with cerebrovascular disease, there is cognitive decline with a pattern suggestive of vascular etiology, as evidenced by ≥1 of the following: ▶ Cognitive deficits temporally related to cerebrovascular events ▶ Decline predominantly in complex attention and frontal-executive function **Probable:** ≥1 of the following present ▶ Neuroimaging showing significant parenchymal injury due to cerebrovascular disease ▶ Neurocognitive symptoms correlate with documented cerebrovascular events ▶ Clinical and genetic evidence of cerebrovascular disease present **Possible:** ▶ No neuroimaging and no documented temporal relationship of cerebrovascular events to cognitive decline are available		Vascular dementia of acute onset (symptoms develop after multiple strokes or a single severe stroke) Multi-infarct dementia (progressive symptoms following multiple transient ischemic episodes and accumulating infarcts) Subcortical vascular dementia (associated with a history of hypertension and foci of injury in white matter, with relatively preserved cerebral cortex) Mixed cortical and subcortical vascular dementia Other vascular dementia Vascular dementia, unspecified	Deficits in: Information processing Complex attention Frontal-executive functioning Evidence of cerebrovascular disease

Major or mild neurocognitive disorder due to traumatic brain injury		Dementia due to injury to the head
Mild / **Major**		Symptoms arrive immediately following head trauma or after the individual gains consciousness.
Noncognitive symptoms exist in conjunction with a history of traumatic brain injury (symptoms occurring immediately after injury and persisting past the acute period), with ≥1 of the following present: ▶ Loss of consciousness ▶ Post-traumatic amnesia ▶ Disorientation and confusion ▶ Neurologic symptoms or injury on neuroimaging		Persists beyond acute postinjury period. Cognitive symptoms vary depending on the location of the injury.
Major or mild neurocognitive disorder due to HIV infection	Dementia in human immunodeficiency virus (HIV)	Dementia due to diseases classified elsewhere
Mild / **Major**		
Neurocognitive symptoms occurring in the presence of HIV diagnosis	Cognitive symptoms developing in the context of known HIV diagnosis	Dementia due to human immunodeficiency virus Confirmed HIV disease No other illness present to explain neurocognitive symptoms Typically subcortical symptoms predominate
Substance/medication-induced major or mild neurocognitive disorder	Mental and behavioral disorders due to psychoactive substance use	Dementia due to psychoactive substances including medications
Mild / **Major**		
Alcohol ▶ Inhalant ▶ Sedative, hypnotic, or anxiolytic ▶ Other (or unknown)	Alcohol, nonamnestic confabulatory type Alcohol, amnestic confabulatory type Inhalant Sedative, hypnotic, or anxiolytic Other (or known)	Amnestic syndrome Residual and late-onset psychotic disorder	Any dementia that is a direct consequence of substance use Exclusion: dementia due to heavy metals or other toxins
Symptoms of cognitive impairment, occurring not solely in the period of intoxication and/or withdrawal that remain present after a period of abstinence Persistent: symptoms remain present after an extended period of abstinence			
Major or mild neurocognitive disorder due to Prion disease	Dementia in Creutzfeldt Jakob disease	Dementia due to prion disease
Mild / **Major**		
Symptoms of cognitive impairment, with insidious onset and rapid progression of deficits; symptoms accompanied by motor features (myoclonus, ataxia) or biochemical marker on testing.	Dementia with significant neurologic symptoms, often with a subacute course and progressive rapid decline.	Insidious and rapid onset of symptoms, including cognitive deficits, ataxia, and motor symptoms. Confirmed by brain imaging and spinal fluid or genetic testing. EEG may also support this.
Major or mild neurocognitive disorder due to Parkinson disease	F02.3 Dementia in Parkinson disease	
Mild / **Major**		
Neurocognitive symptoms occurring in the context of known Parkinson disease diagnosis, frequently involving insidious onset and gradual progression Probable (both of the following met) Possible (one of the following met) ▶ No evidence of mixed etiology ▶ Parkinson disease precedes the onset of neurocognitive disorder	Dementia occurring in the context of Parkinson disease.	

Telegram: @medical_k

www.konkur.in

	Major or mild neurocognitive disorder due to Huntington disease **Mild** **Major** Neurocognitive symptoms occurring in the context of known Huntington disease diagnosis, frequently involving insidious onset and gradual progression	**Huntington disease** Dementia occurs as a result of diffuse degeneration in the brain related to Huntington disease, caused by an autosomal dominant gene; the disease has slow progression and often involves associated motor symptoms of chorea.	**Dementia due to Huntington disease** Insidious symptoms in the 30s or 40s, with gradual/slow progression. Typically executive impairments predominate over memory ≥ before motor symptoms (bradykinesia, chorea) begin.
	Major or mild neurocognitive disorder due to another medical condition **Major or mild neurocognitive disorder due to multiple etiologies** **Unspecified neurocognitive disorder**		
Severity specifiers	**Mild:** impairments in more complex activities of daily living (i.e., money management) **Moderate:** impairment in basic activities of daily living (i.e., eating, dressing) **Severe:** fully dependent on others for all daily activities		
			Other diagnoses included in ICD-11: Dementia due to Parkinson disease Dementia due to exposure to heavy metals and other toxins Dementia due to multiple sclerosis Dementia due to normal pressure hydrocephalus Dementia due to pellagra Dementia due to Down syndrome
Additional symptom specifiers (common to all)	**With or without behavioral disturbance**

Telegram: @medical_k

www.konkur.in

Table 91.
General Personality Disorder

Telegram: @medical_k

www.konkur.in

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	General personality disorder	Disorders of adult personality and behavior	Personality disorder
Duration	Long duration of time, beginning ≥ in adolescence or early adulthood		≥2 years, tends to begin in childhood
Symptoms	A fixed and pervasive pattern of experience and behavior, as manifested in: ▶ Cognition and perception ▶ Affect ▶ Interpersonal functioning ▶ Impulsivity	Includes a variety of patterns of behavior that are persistent and involve a clinical disturbance in interpersonal relationships and views of self. These patterns of behavior and experience are fixed and result in inflexibility	Problems in function in aspects of the self or interpersonal dysfunction Patterns of cognition, emotional experience and expression, and maladaptive behaviors Disturbance occurs in a range of personal/social situations, although certain situations may provoke
Required number of symptoms	≥2 of the above being long-standing and present across a range of social situations		
Exclusions	Other medical condition Substance- or medication-induced, including withdrawal Other mental disorder		Other medical/nervous system conditions Substance- or medication-induced, including withdrawal Other mental disorder Developmentally appropriate behavior
Psychosocial consequences	Distress or psychosocial impairment	Frequently (but not always) associated with distress and difficulties with social performance	
Symptom specifiers			Categorized by traits or patterns: **Negative affectivity in personality disorder or personality difficulty:** tendency to experience a broad range of negative emotions. **Detachment in personality disorder or personality difficulty:** a tendency

Telegram: @medical_k

www.konkur.in

to maintain interpersonal and emotional distance.

Dissociality in personality disorder or personality difficulty: disregard for rights and feelings of others. Self-centered and lacking empathy.

Disinhibition in personality disorder or personality difficulty: acts rashly and impulsively, without consideration of consequences.

Anankastia in personality disorder or personality difficulty: having a rigid focus, commonly manifested by perfectionism and emotional and behavioral constraint.

Borderline pattern: included as an additional specifier, which typically overlaps with the above specifiers. This is meant to indicate a pervasive pattern of instability in interpersonal relationships, self-image, emotions, and a tendency toward impulsivity.

Symptoms include ≥5 of the following:

- Avoidance of abandonment
- Unstable and intense interpersonal relationships
- Identity disturbance
- Acting rashly, often with risky activities (sexual behavior, driving, drinking, or eating)

Telegram: @medical_k

www.konkur.in

			▶ Self-harm ▶ Emotional instability ▶ Feeling empty inside ▶ Difficulty controlling anger ▶ Transient dissociative episodes
Severity specifiers			Severity depends on the range of areas affected
Comments	Includes: **Cluster A:** paranoid personality disorder, schizoid personality disorder, schizotypal personality disorder **Cluster B:** antisocial personality disorder, borderline personality disorder, histrionic personality disorder, narcissistic personality disorder **Cluster C:** avoidant personality disorder, dependent personality disorder, obsessive-compulsive personality disorder	Includes: **Specific personality disorders:** Paranoid personality disorder, schizoid personality disorder, dissocial personality disorder, emotionally unstable personality disorder, histrionic personality disorder, anankastic personality disorder, anxious (avoidant) personality disorder, dependent personality disorder, other specific personality disorders (eccentric, haltlose, immature, narcissistic, passive-aggressive, psychoneurotic), personality disorder unspecified **Mixed and other personality disorders** **Enduring personality changes:** due to brain damage and disease, after a catastrophic experience, after psychiatric illness, chronic pain personality syndrome, enduring personality change unspecified

Table 92.
Specific Symptoms and Exclusions for Individual Personality Disorders

DSM-5-TR		ICD-10		ICD-11
Paranoid personality disorder		**Paranoid personality disorder**		Note: ICD-11 has switched to a different categorization of personality disorders, more in alignment with DSM's Alternative Model for Personality Disorders. See ICD-11 Personality Disorders for a description of these.
Symptoms	Exclusions	Symptoms	Exclusions	
A pervasive and enduring pattern of suspiciousness is seen in the presence of ≥4 of the following: ▶ Suspicion or paranoia that others are out to get them ▶ Excessive doubt regarding the loyalty of others ▶ Fear of trusting or confiding in others ▶ Perceiving threatening meaning on events or statements by others ▶ Frequently holding grudges ▶ Perceiving attacks by others ▶ Suspiciousness regarding the fidelity of a partner	Schizophrenia Depression with psychotic features Other medical condition Substance- or medication-induced, including withdrawal Other mental disorder	Excessive sensitivity to setbacks or insults Suspiciousness Distorting experiences by perceiving normal interactions as hostile or threatening Suspiciousness regarding the fidelity of a partner It may be associated with self-importance or excessive self-reference	Psychosis Schizophrenia Paranoid state	
Schizoid personality disorder		**Schizoid personality disorder**		
Symptoms	Exclusions	Symptoms	Exclusions	
A pervasive and enduring pattern of detachment from interpersonal relationships, as defined as the presence of ≥4 of the following: ▶ Lack of pleasure from relationships ▶ Pursuing solitary activities ▶ Little interest in sexual experiences with others ▶ Lack of pleasure in many activities ▶ Absence of close social connections ▶ Indifference to how others may perceive them ▶ Detachment or flattened affect	Schizophrenia Depression with psychotic features Bipolar disorder with psychotic features Autism spectrum disorder Other medical condition Other mental disorder	Withdrawal from affection or social contact Preference for fantasy, isolation, and introspection Limited ability to express emotions Limited ability to experience pleasure	Asperger syndrome Delusional disorder Schizophrenia Schizotypal disorder	
Schizotypal personality disorder		**Schizotypal disorder**		
Symptoms	Exclusions	Symptoms	Exclusions	
A pervasive and enduring pattern of difficulties with social interaction and perceptual disturbance as defined as the presence of ≥5 of the following: ▶ Ideas of reference ▶ Strange beliefs or magical/bizarre thinking ▶ Odd perceptual experiences ▶ Odd speech or thinking ▶ Suspiciousness or paranoid ideation ▶ Odd or constricted affect ▶ Eccentric behavior ▶ Lack of friends or social connections ▶ Social anxiety due to paranoia	Schizophrenia Depression with psychotic features Bipolar disorder with psychotic features Autism spectrum disorder Other psychotic disorder	Classified in ICD under schizophrenia, schizotypal, and delusional disorders as opposed to a personality disorder Eccentric behavior and abnormal thinking are similar that that seen in schizophrenia, though no diagnostic criteria for schizophrenia met May have a cold affect, odd behavior, tendency to avoid social interaction Perceptual disturbance with quasi-psychotic episodes with illusions, delusion-like ideas, and/or hallucinations, though without clear onset and course more similar to that of personality disorders	Asperger syndrome Schizoid personality disorder	

Telegram: @medical_k

www.konkur.in

Antisocial personality disorder

Symptoms	Exclusions
The pervasive and enduring presence of ≥3 of the following, occurring since the age of 15 and diagnosed no earlier than the age of 18, with evidence of conduct disorder before the age of 15: ▶ Not following social norms with regard to the law ▶ A pattern of deceitfulness and lying ▶ Impulsivity ▶ Irritability and/or aggressiveness ▶ Blatant disregard for the safety of self or others ▶ Irresponsibility with regard to work, social, and personal obligations ▶ Lack of remorse	Schizophrenia Bipolar disorder

Dissocial personality disorder

Symptoms	Exclusions
Disregard for social expectations or obligations Lack of concern for the feelings of others Behaviors starkly different from those expected per social norms Low distress/frustration tolerance Low threshold for aggression or violence Tendency to blame others	Conduct disorders Emotionally unstable personality disorder

Borderline personality disorder

Symptoms

A pervasive and enduring pattern of interpersonal conflict and impulsivity as evidenced by ≥5 of the following:

- An excessive effort to avoid real or feared abandonment
- Unstable and frequently intense interpersonal relationships, with a pattern of alternating between idealization and devaluation
- Unstable image of self
- Impulsivity resulting in self-harm
- Pattern of suicidal behaviors, gestures, threats, or self-injury
- Affective lability
- Chronic feelings of emptiness
- Difficulties managing anger
- Intermittent stress-related paranoia and/or feelings of dissociation

Emotionally unstable personality disorder

Symptoms	Exclusions
Tendency to impulsiveness Unpredictable and labile mood Behavioral and/or emotional outbursts are common Frequent conflict with others Two distinct "Types" include: ▶ Impulsive type (emotional lability and lack of impulse control) ▶ Borderline type (disturbance of self-image, self-worth, and interpersonal relationships, with associated self-destructive behavior)	Dissocial personality disorder

Histrionic personality disorder

A pervasive and enduring pattern of needing attention and experiencing strong emotions as evidenced by ≥5 of the following:

- Discomfort in situations in which the individual is not the main object of attention
- Excessively sexual or provocative behavior in interpersonal interaction
- Labile emotions
- Use of physical appearance to draw attention
- Impressionistic style of speech
- Exaggerated expressions and speech
- High suggestibility
- Perceives relationships as being more intimate than they actually are

Histrionic personality disorder

Shallow and labile affect
Self-dramatization
Exaggeration of speech and affect
Suggestibility
Egocentricity
Lack of concern for others
Attention seeking
Easily offended or hurt emotionally

Telegram: @medical_k

www.konkur.in

Narcissistic personality disorder

A pervasive and enduring pattern of self-importance and lack of empathy as evidenced by ≥5 of the following:

- Grandiosity with regard to own achievements
- Preoccupation with fantasies of success
- A belief in being unique or special compared to others
- Need for admiration and external validation from others
- Expects special treatment from others
- Exploitative in interpersonal relationships
- Pervasive lack of empathy
- Jealousy toward others or belief that others are envious of them

Arrogance

Narcissistic personality (see "Other specific personality disorders" below)

Avoidant personality disorder

A pervasive and enduring pattern of hypersensitivity and lack of confidence as evidenced by ≥4 of the following:

- Avoidance of interpersonal contact
- Avoidance due to fear of being unliked
- Restraint in intimate relationships due to fear of being shamed
- Preoccupation with fear of rejection or criticism
- Inhibition in interpersonal relationships
- Perception of being inferior or inadequate
- Reluctance to engage in new things due to fear of embarrassment or shame

Anxious (avoidant) personality disorder

Excessive apprehension, insecurity, and/or inferiority compared to others
Need to be accepted
Fear of or hypersensitivity to rejection
Shallowness of interpersonal relationships
Avoidance of certain daily activities or everyday situations due to an exaggerated perception of risk

Dependent personality disorder

A pervasive and enduring pattern of needing care from others and fear of separation as evidenced by ≥5 of the following:

- Difficulty making day-to-day decisions without input or reassurance from others
- Avoiding assuming responsibility for major areas of life
- Difficulty disagreeing with others due to fear of disapproval
- Difficulty initiating things due to lack of confidence or fear of judgment
- Excessively seeking acceptance, such as taking on unfavorable tasks
- Discomfort with being alone due to fear of not being able to adequately care for oneself independently
- Immediately seeks new relationship when one ends
- Excessive fear of having to take care of themselves

Dependent personality disorder

Excessive reliance or need for validation from others
Difficulty making daily decisions without approval from others
Fear of abandonment
Feelings of helplessness or incompetence
Passive compliance with the wishes of others
Tendency to avoid direct responsibility

Obsessive-compulsive personality disorder

A pervasive and enduring pattern of needing care from others and fear of separation as evidenced by ≥4 of the following:

- Preoccupation with rules, details, or order
- Perfectionism interferes with the completion of tasks
- Devotion to work at the cost of interpersonal relationships
- Inflexibility of thinking with regard to rules or ethics
- Difficulty parting with old objects despite not having sentimental value
- Difficulties delegating or working with others
- Miserliness with regard to spending on self or others
- Rigidity and/or stubbornness

Anankastic personality disorder

Symptoms	Exclusions
Excessive feelings of doubt Excessive perfectionism, checking, preoccupation with detail Stubbornness/rigidity Excessive caution May also be associated with unwanted thoughts or impulses that do not reach the severity level of obsessive-compulsive disorder	Exclusions: obsessive-compulsive disorder

Other specific personality disorders

Eccentric personality
"Haltlose" type personality: marked selfishness, irresponsibility, and hedonism
Immature personality
Narcissistic personality
Passive-aggressive personality
Psychoneurotic personality

19. PARAPHILIC DISORDERS

www.konkur.in

Table 93.
Voyeuristic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Voyeuristic disorder	Voyeurism	Voyeuristic disorder
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, sexual urges resulting from observing an unknowing person undressing or engaging in sexual activity The individual must be 18 years or older at the time of diagnosis	A pattern of watching people engage in sexual behaviors or other intimate behaviors, such as undressing, with the individual experiencing sexual pleasure from the experience; those being observed are often not aware	Sustained focus and pattern or arousal from observing an unsuspecting person naked or disrobing Has acted on these thoughts or been distressed by them
Exclusions			Children or (usually) adolescents Single or limited instances
Psychosocial consequences	Distress or psychosocial impairment		
Symptom specifiers	***In a controlled environment*** *(if the individual lives in an institution or other controlled environment)*		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)		

Telegram: @medical_k

www.konkur.in

Table 94.
Exhibitionistic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Exhibitionistic disorder	Exhibitionism	Exhibitionistic disorder
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, sexual urges, and sexual behaviors resulting from the act of exposing one's genitals to unsuspecting individuals	A pattern of exposing genitals to strangers, often of the opposite sex, or exposing genitals in public places; such exposure is frequently associated with sexual excitement/arousal and may be followed by masturbation.	Sustained and focused pattern or arousal from exposing one's genitals to unsuspecting person in public Has acted on these thoughts or been distressed by them
Exclusions			Children or (usually) adolescents Single or limited instances
Psychosocial consequences	Distress or psychosocial impairment		
Symptom specifiers	**Sexually aroused by exposing genitals to prepubertal children** Sexually aroused by exposing genitals to physically mature individuals Sexually aroused by exposing genitals to prepubertal children and to physically mature individuals **In a controlled environment** (if the individual lives in an institution or other controlled environment)		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)		

Telegram: @medical_k

www.konkur.in

Table 95.
Frotteuristic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Frotteuristic disorder	Other disorders of sexual preference *Frotteurism*	Frotteuristic disorder
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, sexual urges, and sexual behaviors resulting from touching or rubbing against a nonconsenting individual	Sexual arousal through rubbing against people in public spaces	Sustained and focused pattern or arousal from touching or rubbing against a nonconsenting person Has acted on these thoughts or been distressed by them
Exclusions			Children or (usually) adolescents Single or limited instances
Psychosocial consequences	Distress or psychosocial impairment		
Symptom specifiers	**In a controlled environment** (if the individual lives in an institution or other controlled environment)		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)		
Comments		Also includes *Necrophilia,* in addition to behaviors such as making obscene phone calls, engaging in sexual activity with animals, and use of strangulation for sexual excitement

Table 96.
Sexual Masochism Disorder/Sadomasochism

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Sexual masochism disorder	Sadomasochism	Paraphilic disorder involving solitary behavior or consenting individuals
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, and sexual urges resulting from being humiliated, hit, bound, or made to suffer.	Preference for sexual activity to include bondage or the infliction of pain or humiliation as the recipient (masochism) or as the one inflicting on another (sadism), with associated sexual excitement	General category for a pattern or atypical sexual arousal Causes distress and significant risk of injury
Psychosocial consequences	Distress or psychosocial impairment		Marked distress
Symptom specifiers	**With asphyxiophilia** (sexual arousal related to restriction of breathing) **In a controlled environment** (if the individual lives in an institution or other controlled environment)		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)		

Telegram: @medical_k

www.konkur.in

Table 97.
Sexual Sadism Disorder/Sadomasochism

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Sexual sadism disorder	Sadomasochism	Coercive sexual sadism disorder
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, and sexual urges resulting from inflicting psychological suffering or humiliation on others.	Preference for sexual activity to include bondage or the infliction of pain or humiliation as the recipient (masochism) or as the one inflicting on another (sadism), with associated sexual excitement	Sustained and focused pattern or arousal from inflicting physical/psychological suffering on a nonconsenting person Has acted on these thoughts or been distressed by them
Exclusions			Children or (usually) adolescents Single or limited instances
Symptom specifiers	**In a controlled environment** (if the individual lives in an institution or other controlled environment)		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)

www.konkur.in

Table 98.
Pedophilic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Pedophilic disorder	Pedophilia	Pedophilic disorder
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, sexual urges, and sexual behaviors involving sexual activity with prepubescent child or children Individual must be 16 years or older at the time of diagnosis and must also be a minimum of 5 years older than the child of sexual interest	Sexually preferring young boys and girls, often those of prepubertal or early pubertal age	Sustained and focused pattern or arousal from prepubertal children Has acted on these thoughts or been distressed by them
Required number of symptoms	Both of the above		
Exclusions	Individual of adolescent age in a relationship with another child aged 12 or 13		Children or (usually) adolescents Single or limited instances Cultural variations in acceptable behavior
Psychosocial consequences	Distress or psychosocial impairment		
Symptom specifiers	**Exclusive type:** attracted only to children Nonexclusive type Sexually attracted to males Sexually attracted to females Sexually attracted to both males and females Limited to incest		

Telegram: @medical_k

Table 99.
Fetishistic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Fetishistic disorder	Fetishism	Paraphilic disorder involving solitary behavior or consenting individuals
Duration	≥6 months		
Symptoms	Sexual arousal, sexual fantasies, sexual urges, and sexual behaviors resulting from inanimate objects or a highly specific nongenital body part	Using nonliving objects as a source of sexual arousal or gratification or a way to enhance sexual excitement.	General category for a pattern or atypical sexual arousal. Causes distress and significant risk of injury.
Exclusions	Limited to: ▶ Clothing related to cross-dressing (transvestic disorder) ▶ Use of devices related to genital stimulation		
Psychosocial consequences			Marked distress
Symptom specifiers	Body part(s) Nonliving object(s) Other **In a controlled environment** (if the individual lives in an institution or other controlled environment)		
Course specifiers	**In full remission** (no action on urges and no related distress or impairment over ≥5 years while in a noncontrolled environment)		

Telegram: @medical_k

Table 100.
Transvestic Disorder

	DSM-5-TR	ICD-10	ICD-11
Diagnostic name	Transvestic disorder	Dual-role transvestism Fetishistic transvestism	Paraphilic disorder involving solitary behavior or consenting individuals
Duration	6 months or longer		
Symptoms	Sexual arousal, sexual fantasies, and sexual urges resulting from cross-dressing	*Dual role:* enjoyment associated with temporarily wearing clothes of the opposite sex, but without associated sexual excitement or associated desire for permanent sex change *Fetishistic:* wearing clothes of the opposite sex associated with sexual excitement and desire to remove clothing once orgasm occurs and arousal declines	General category for a pattern or atypical sexual arousal. Causes distress and significant risk of injury
Psychosocial consequences	Distress or psychosocial impairment		Marked distress
Symptom specifiers	**With fetishism:** sexual arousal from specific fabrics or garments) **With autogynephilia:** sexual arousal from imagining self as a female **In a controlled environment:** if the individual lives in an institution or other controlled environment		
Course specifiers	**In full remission:** no action on urges and no related distress/impairment ≥5 years while in a noncontrolled environment
